394 C. M. Van Reed, San Francisco: nineteen curiosities from Japan. [See Art Gallery cat.]

395 L. Prevost, San Jose Nursery: seven boxes Silk Worms and Cocoons.

Mr. Prevost is the pioneer silk culturist of California. He made a small exhibition last year; but his present exhibit is far more imposing, and shows a progress highly creditable to his industry and indicative of a rapid future growth of silk culture in California. His collection of cocoons is very large and unusually fine. He also exhibits in connection therewith samples of the silk-worm and the leaf upon which they live, the eggs from which it is hatched, and the butterfly into which it changes when it leaves the cocoon; also the cast-off carcass which they leave behind. Mons. Prevost commenced the culture of the silk-worm in 1860, and the present year he will have fully 100,000 cocoons. His labors thus far have been chiefly experimental; but his experiments have resulted in fully demonstrating the most superior adaptability of California, both in climate and soil, to the culture of the silk-worm.

396 Dr. D. R. Beckford, San Francisco: one case Golden Eye Water.

397 E. J. Cummings, San Francisco: two jars Preserved Fruit, six years standing.

This lot of fruit was put up six years ago. The perfectness with which it has been kept for that length of time speaks well for the manner in which it has been put up.

398 Theodore Van Tassel, San Francisco: one case Silk Hats.

The taste and finish of this case of hats can hardly be excelled anywhere.

399 J. A. W. Lamborg, San Francisco: one case Spring Flower Dentifrice.

404 Gallagher, Weed & White, 125 First street, San Francisco; specimens of Brass Castings; lot Sheathing Nails.

This exhibit is intended to show the manner in which small articles of brass and copper are cast—a large number of them being strung together in one casting. The mode of casting the nail is particularly worthy of notice.

406 Wm. Brucknar, San Francisco: one rotary Roasting Furnace.

This furnace has been devised to simplify and cheapen the process of desulphurizing auriferous and argentiferous sulphurets. It dispenses with the large and cumbrous reverberatory hearth, and tall and expensive chimney necessary for getting up a suitable draft. The laborious and tedious process of hand stirring is also obviated. The furnace consists of a cylindrical iron grating, lined with brick, and having an orifice at each end about one-third the diameter of the cylinder. Upon the inside of the cylinder will be noticed a winding ridge, or riffle, the object of which is to distribute the ore and keep it constantly exposing fresh surfaces to the action of the flames, as the cylinder is made to revolve. This revolution may be produced in any convenient manner. In the one on exhibition it is caused by an endless chain passing over a revolving pulley. The cylinder rests upon friction rollers, upon which it is caused to revolve instead of upon an axis. A small furnace is placed at one end, from which the flame is caused to pass into and through the cylinder; atmospheric air is also allowed to pass freely into the cylinder to hasten the process of desulphurization. The first cost of construction, the cost of fuel for continuing the operation, and that of labor for attendance, and time occupied in the process, are all vastly reduced. We are not aware that it has yet been subjected to any protracted, practical experiment; but we can see no reason, either mechanical or philosophical, which shall militate against its successful introduction against the ordinary reverberatory hearth, for desulphurizing ores. It is well worth the careful examination of all parties interested in metallurgical operations

407 Peter Thompson, San Francisco: one box Lettuce.

409 F. Williams, San Francisco: one lot Curtis' Yeast Powder.

410 Newman Bro., six pieces Willow Furniture.

This exhibit consists of two settees, one rocking chair, one arm-chair, and two small chairs—all made of willow.

412 John Dean, San Francisco: one bottle California Brandy, made in Sacramento.

413 Marsh, Pillsbury & Co., San Francisco: one case Hardware, J. E. Blackmore manufacturer; four Weather Vanes; lot Lead Crucibles, Horton Chucks; lot solid Emery Wheels.

This display consists of a large assortment of carpenters' and machinists' small tools and engineers' instruments, cutlery, black lead crucibles, etc. The exhibition is very neat and creditable.

415 A. Conrad, San Francisco: two Desks; one Chair.

417 J. A. Hobart, Oakland: one large size Hutchinson's Cider and Wine Mill.

418 N. S. Barton, San Francisco: one Boston Corn Sheller

419 Josiah Deady, San Francisco: one lot gang and circular sawed Lumber.

This lot of lumber was sawed by one of Hendy's Gang Circular Saw Mills; the only mill that saws dimension lumber direct from the log by one movement of the carriage. Parties interested will do well to examine this lot of lumber carefully, and notice the evenness of dimension with which it is sawed. On comparison with lumber cut by the ordinary circular saw, this feature in the work of the "gang saw" will be at once apparent.

420 Wesson & Kimball, San Francisco: one lot Lumber.

This lot of lumber was cut by the ordinary circular saw.

422 Wm. P. Harrison, agent San Lorenzo Paper Mill: lot Straw Paper; lot Board Paper; lot Newspaper.

423 Wm. P. Harrison, San Francisco: one case of Electrotyping.

424 C. Roberts & Co., San Francisco: one Mining Car; one Mining Wheelbarrow; two Canal Wheelbarrows.

This car was manufactured by the exhibitor, in this city, and is a substantial piece of workmanship, well calculated for the rough work for which it has been devised. The further end is hung upon a pivot, with a catch at the bottom, which is worked with a crank from the opposite end, making the matter of "dumping" perfectly easy and convenient for the car-man.

425 H. T. Graves & Co., San Francisco: Wire Summer House; two rolls California manila brass wire Quartz Screens; Ore Screen; Grape Stove; Coal Screen; Sand Screen; two brass Feeders; seventeen rolls Iron Wire Cloth; six round Rat-Traps; fifteen Foundry Rabbits; lot of Flour Sieves; lot Wire Frames and Stands; Cheese Safe; Wire Screen for doors and windows.

This is a very fine exhibit of wire goods, of almost every description, all manufactured at the wire goods factory of the exhibitor, in this city. The work is fully equal to the best imported, and attests to the most complete success in this useful branch of our home industry.

426 F. Morris & Co., San Francisco: large specimen gold and silver bearing Quartz. [See cat. minerals.]

427 The Singer Manufacturing Co., 139 Montgomery street, San Francisco: five "Letter A" Family Sewing Machines, inclosed in folding cases; eight "Letter A" Family Machines with folding covers; one "No. 3" Standard Vibrating Presser Machine, for harness and carriage trimming; four "No. 2" Standard Machines, for general manufacturing work, such as tailoring, boots and shoes, etc.; one old style Cabinet Family Machine.

It is contended by the proprietors, that while this machine possesses the general features of utility belonging to all the other sewing machines now in popular use, it also has a Folding Case, the advantages of which are: First—protection to the machine when not in use. Second—it makes a fine table when it is in use for the work to rest upon. Third—the whole case, inclosing its treasure of mechanism, is not only ornamental, but useful in the highest degree. Attached is a vibrating Foot Presser, also, which boasts three important features of superiority, to wit: First—the use of this Foot Presser obviates the necessity of oiling the material to be sewn in order to facilitate the operation of feeding it. Second—the vibrating Foot Presser, unlike the stationary foot, when patent or enameled leather is being sewn, leaves no mark or trace behind it, not even on the finest enameled leather. Third—the vibrating Foot Presser (which is used in all kinds of fancy stitching), permits any curve to be turned while the machine is in motion.

428 C. A. Fletcher, 1 Montgomery street, San Francisco: one Youths' Embroidered Suit, entered for competition.

429 C. C. Keeno, San Francisco: one case of Accordeons and Flutenas.

This exhibitor was awarded the first premium, last year, for his home manufactured flutinas and accordeons, which the committee last year pronounced, in their report, "superior to any which we have ever seen." His present exhibition is fully equal to his last.

430 Devoe, Hinsmore & Co., cor. Fremont and Mission streets, San Francisco: two Grate Bar Patterns.

432 J. H. Hammond, San Francisco: one Uniform Suit; one Gents' Business Suit; one Gents' Dress Suit.

There is a merit connected with this exhibition of clothing, apart from the durability of material and excellency of make. The stock is of California growth and manufacture, the cloth having been manufactured at the Mission Woolen Mills, and from California wool.

433 Deming & Co., San Francisco: one lot of Howe's Sewing Machines.

This machine was patented in 1846. There is an improvement to prevent the missing or dropping of stitches; also to prevent the breaking of needles; also, an adjustable cloth presser foot has been added, which enables the finest hemming to be done without the use of a hemmer. These machines sew silk, cotton, or linen thread, from delicate gauze to harness leather.

434 Jules Rollard, San Francisco: one Bed Lounge, entered for premium.

This lounge is entered for a premium. It is of an extension make, arranged to close up in a very neat and compact manner. Both the cabinet and upholstery work has been done in a very creditable manner.

436 P. Diesenfield, San Francisco: one Billiard Table.

The cabinet work of this table is elegant and most unexceptionable, and it is presumable that its playing qualities are in no wise inferior. As a piece of California workmanship, it is most especially worthy of notice, and will not suffer in comparison with similar work from any manufactory.

437 A. Berzerot, San Francisco: two Stamps.

438 A. Folsom, San Francisco: one Safe.

440 I. D. Thompson, 321 Montgomery street, San Francisco: one lot American Liquors.

This exhibit presents a very neat and tasteful display. It consists of California white wine and red or claret wine, both manufactured by Mr. Isaiah Branham, of San Jose; of Bourbon bitters, manufactured in this city, by the exhibitor, and apple brandy and four kinds of whisky, imported. Mr. Thompson is an extensive importer of liquors, the choicest brands of which, both of home manufacture and imported, may always be found at his place of business, No. 321 Montgomery street.

444 J. L. Noy, San Francisco: one Silk Basque.

445 Mullear & Bender, 123 Kearny street, several self-regulating Bench Planes, George Mullear inventor, San Francisco, patented 1865.

This device is designed to avoid the delay and inconvenience experienced from the clogging of the plane, as ordinarily constructed. With this improvement it is impossible for a plane to clog. The cutting iron being firmly held, no vibration can occur, consequently the tool accomplishes its work much neater, and requires less force, than with the instrument now in general use.

440 Wheeler & Randall, San Francisco: one Excelsior Amalgamator.

This is a medium or prospecting size pan, of the Wheeler & Randall tractory pattern. Its peculiarity consists in having grinding surfaces so constructed (according to the aim of its inventors) to wear equally at all points. The tractory curve has long been known, and relics have been found which go to show that it was applied to the grinding of wheat as far back as the early days of Rome. Tractory conoidal plates differ essentially in form from plane circular and from conical plates; and if there is any dependence to be placed upon mathematical demonstrations, as applied to mechanical effects, it would appear that there is also a marked difference of efficiency, as well as in form, when these plates are applied to grinding purposes of any kind.

447 Geo. M. Wood, San Francisco: one show case, containing samples of engraved Door Plates, Seals, Stamps, &c.; one Seal Press, and lot of Diamond Cement.

This show case opens in the back, so as to exclude all dust and rain; it is especially adapted to fasten outside, where it will be exposed to the weather. The Diamond Cement is for mending glass, china or earthenware.

The cement, exhibited, it is claimed, will mend broken glass, china, or earthen china ware. The show case opens on the back, and is made so as to exclude all dust and rain, and is especially adapted to post up outside of a press door, where it will be exposed to the weather.

449 R. Liddle & Co., 538 Washington street: three cases Sporting Goods; one rack of Muskets, Swords, &c.

These articles are entered for competition. They embrace a very fine display.

450 S. O. Brigham, 111 Montgomery street: one case Stamps for braiding and embroidery work.

These stamps are said to be the latest and best in use, and stamp clear and plain. They are made by the exhibitor, and are entered for competition and premium.

451 Strong & Co., Main street, between Folsom and Harrison, San Francisco: one Union Amalgamator.

The peculiarity and superiority especially claimed for this amalgamator is its double grinding surfaces with reverse motion, and the peculiar manner in which the mullers are attached to the arms. The double grinding surfaces are obtained by having two sets of mullers running in opposite directions, and so arranged as to form a grinding surface between themselves, and another between the lower mullers and a set of dies, as ordinarily affixed to the bottom of the pan. The mullers are attached to the arms by ball and socket joints, by which the pressure is at all times equal and self-regulating. The peculiar motion of the mullers establishes a strong rotary current, from the top to the bottom of the pan, just sufficient to produce the proper flow of the pulp from, to and through the several grinding surfaces, without any other aid than the mere motion of the mullers themselves.

452 W. Bradley, San Francisco: one Banjo.

This instrument is of California manufacture, and is a most creditable piece of workmanship.

458 Kerby, Byrne & Co. San Francisco: one Velvet Circular; two plaid Circulars; one Silk Basque; one Silk Sacque; one case Silks.

This exhibit attracts large crowds of ladies, who appear to never tire of examining the rich array of elegant silks, laces, cloaks and domestic goods, which are here so tastefully and temptingly displayed. The goods are all of the latest and most exquisite styles, and of patterns and colors best suited to refined and cultivated tastes. A very elegant description of cloak is exhibited, of a style introduced last year, and which is expected to receive the stamp of popular favor during the present season. The ladies all pronounce it "splendid." It is really magnificent. They also exhibit several cloaks of their own manufacture. The taste and judgment displayed in the selection and arrangement of that elegant case of goods reflects the highest credit upon this well known and popular firm. After examining the elegant display at the Pavilion, the ladies cannot fail to take a look at their extensive assortment, at No. 7 Montgomery street.

[To be Continued.]

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, August 19.

212 shs Chollar at 506@507½ per foot.

Amount of sales.....$286,128 00

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, August 26th, 1865.

The money market is abundantly supplied with available capital, and we have rarely had occasion to note so great an accumulation of unemployed means seeking investment as at this time. Bank rates rule at 1¼@1½ P cent. per month, but borrowers in good credit, and others with first-class collateral, can readily negotiate loans upon more favorable terms.

Receipts of treasure from the interior and north coast, since Saturday last, have been large, and amounted to $1,500,000; making an aggregate of some $3,800,000 thus far during the current month.

Bullion is rather more abundant this week, and gold bars were taken to account by bankers at 820@830; silver bars are selling at par to ¾ P cent discount.

Legal Tender Notes have been in rather less favor, and small sales were made within a range of 74½@73½c, seller 30, closing at 73¾c. bid, 74c. asked. Our latest telegraphic advices from the East quote gold at 143 on the 15th instant.

The Mining Share market, early in the week, exhibited more firmness than for some time past, and a number of leading shares were in decided request at enhanced rates. During the past day or two, prices, for the most part, have shown a decline, but some stocks at the close are again higher and appear to be well controlled.

Low priced shares have been active, and large sales were made at variable rates, closing firmly. City stocks are still in favor, and are not offered except at full rates.

San Francisco 7 per cent. bonds of 1862 are inquired for at 76. California Steam Navigation rose from $780 to $800 P share, closing at $820 bid. State Telegraph is in more favor at $30 bid. Spring Valley Water was sold at $51, and closing at 51¼ asked. The receipts of this company exceed $40,000 in July, and this month will amount to some $37,000. North Beach and Mission Railroad is in demand at $39½ per share, and Pacific Insurance Company has risen to $160 bid.

Gould & Curry met with trifling sales at $1,475@1,450, and is now offered at $1,350. We learn of nothing new from this claim.

Alpha has been well maintained, and 17 feet were dealt in, advancing from $1,475 to $1,550, then selling at $1,860—assessment of $360 delinquent—and closing at $1,850 asked. The pay streak discovered last week, in the lower level, is said to show some improvement. The company have recently purchased the Pacific mill, together with all its appurtenances, for the sum of $108,000, of which amount $20,000 was payable in cash, and the balance is to mature in regular monthly installments, extending over a period of ten months, with interest at the rate of 1¼ P cent. per month. This mill is said to be well constructed and efficient in every respect, with a crushing capacity of 50 tons per day.

Yellow Jacket was very active at fluctuating rates, opening at $1,340, advancing to $1,500, receding to $1,400, rallying to $1,420, and selling yesterday at $1,470@1,530, some 289 feet in all changing hands. Advices from this mine are meager this week, but we are informed that no material change has taken place recently.

Savage is in rather less favor, declining from $1,360 to $1,315 advancing to $1,325, and selling at the close at $1,300. A strike for higher wages, on the part of some of the workmen employed in this mine, interfered with active operations for a brief period this week, but we learn that this difficulty has since been arranged, and that the full force of the company are now at work again.

Crown Point rose from $1,200 to $1,290, fell to $1,175, and sold at the close at $1,160@1,200, within which range 81 feet were dealt in. There is no change in the appearance of the 230-feet level, and the drift is vigorously underway east from the shaft in the 300-feet station. This company have purchased the Rhode Island mill for the sum of $60,000, and propose to increase its reduction capacity to 50 tons per day.

Belcher has been very inactive and dull at $860@840, closing at $835 bid. About 90 tons of fair ore are now daily taken from the upper portion of the claim. The shaft is now completed to a depth of 535 feet, and operations are in progress for a thorough development of this mine in the two lower levels, 420 and 520 feet from the surface.

Hale and Norcross has revived a little, and some 50 feet were sold, advancing from $500 to $580, receding to $520, and selling yesterday at $495@510. In drifting west from the south drift at a vertical depth of 700 feet, a body of quartz, interspersed with some good ore, has been met with this week.

Ophir receded from $390 to $355, seller 30, rallied to $365 cash, fell to $350, and closed at about $350 bid. Central was sold at $200 per foot.

Empire Mill and Mining Company was dealt in to the extent of 28 shares at $420@390 per share, closing at $395 asked. It is said that a large portion of the stock belonging to a certain estate has been on the market this week. The product of this mine exceeded 2,650 tons in July, and its yield during the current month has averaged about 80 tons per day, all of which latter is being reduced at the company's two mills.

Chollar fell from $500 to $497½, rallied to $500, and closed at $485 bid. In all 129 feet were sold. The south mine is said to look well.

Potosi is in rather less favor, and 104 feet changed hands, steadily declining from $471 to $456, and selling yesterday at $445. The joint product of these two mines now exceeds 130 tons of ore per day, and the receipts of bullion will show some improvement this month.

Uncle Sam has attracted less attention, and small sales were made, advancing from $210 to $225, and selling at the close at $215@210.

Imperial has been very largely dealt in, and more than 1,350 shares were sold, declining from $260 to $250, rallying to $260, receding to $230, rallying to $236, and changing hands yesterday at $235@250. Nevada advices speak highly of this claim, and the yield of bullion for the current month, from the company's two mills, will, it is thought, exceed $130,000, the ore reduced having been unusually productive. Since the 10th inst., the actual shipments from the mine have been $90,200. The ordinary expenses of the company for August will probably amount to less than $40,000, and a surplus of some $15,000 remained at their credit after the payment of the last dividend. It is rumored that there will be no increase of the dividend for this month, but that nearly all of the surplus which may remain on hand, say $65,000 after paying $10 per share, will be used in the purchase of supplies for the winter! A portion of the net earnings this month will doubtless be required for quicksilver, acid, etc., but nothing has been determined upon with regard to the dividend.

Bullion rose from $170 to $190, fell to $180, and is now offered at $155. Confidence fell from $133 to $117, rallied to $127, and sold yesterday at $125. Daney rose from $62½ to $80, fell to $57½, rallied to $70, receded to $65, and closed at $75@70.

Exchequer has been sold at $44@45, and is now offered at $40. Burning Moscow is inactive at about $34. Sierra Nevada advanced from $18 to $24, fell to $21½, and sold yesterday at $21@24.

The total sales of Stocks and Legal Tender notes since Saturday last, amounted to $1,348,150.

New Mining Advertisements.

Continued Mining Advertisements will be found on other pages.

Globe Gold and Silver Mining Company. Moultor District, Alpine county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of August, 1865, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, or to ISAAC S. POWERS, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 23d day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Thursday, the 12th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

V. B. POST, Secretary.

Office, 1421 Taylor street, San Francisco, Cal. au26-5w

Honcut Miner Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 22d day of July, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Office, 15 Montgomery Block, San Francisco. au26-3w

Table Mountain Copper Mining Company, Stanislaus District, Calaveras county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of August, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, in San Francisco, or to J. M. PIKE, Superintendent, at Copperopolis.

Any stock upon which said assessment shall remain unpaid on Saturday, the 23d day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Thursday, the 12th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, 436 Jackson street, San Francisco, Cal. au26

Wisconsin Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 12th day of July, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificates.	No. Shares.	Amount.
Amundson, Thomas	43 44 45-10 ea	30	$26 80

STILL PROGRESSING!

THE OFFICE OF THE

Mining and Scientific Press

was removed, April 8, to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a

JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

E. D. WATERS, JR., } Proprietors. { W. B. EWER,
C. W. M. SMITH, } { A. J. DEWEY,

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

[From the Daily Fair Press, Saturday, August 19.]

MATHEMATICAL DRESS MODELS.

If there was any one thing more than another that a mother delights in, it is to see her children well dressed. Our American mothers, as a general thing, are the architects, if not the makers of their own apparel, and that of their little ones. For this reason, any invention which facilitates their labor is received with emotions of genuine delight. The mathematical dress models of Mrs. Curtis are the latest, and incomparably the best patterns for dress cutting, of any yet known to modern science. They are so constructed and designed that they can be used for cutting dresses of all sizes, shapes, fashions, and from every conceivable kind of fabric, whether wool, cotton, linen, satin, silk, or what not. They have, on account of their great superiority, supplanted all other models in the public estimation; and their unrivalled excellence is certified to by many ladies well known to the citizens of San Francisco, among whom may be named Mrs. Bishop Kip, Mrs. J. P. Hoge, Mrs. Treat, Mrs. Ireland, Mrs. Cummusky, Mrs. Ellsworth, Mrs. M. P. Beuton, Sister Francis McEnuis, of the Roman Catholic Orphan Asylum, Mrs. Connor, Mrs. Dr. Newell, Mrs. Sather, Mrs. Ellsworth, and hundreds of others.

The process of cutting is accomplished through a series of cards, laid off mathematically. After the measure has been taken, the tape-line is put upon these figures, according to the number of inches of the waist, arm, skirt, or other part of the body, and the pattern marked in such accurate manner as to render it impossible to be otherwise than a perfect fit. Any lady, after the first lesson, can readily comprehend the whole system and put it into immediate practice.

We regard the models the simplest and yet most useful articles ever introduced into a family. A child of eight years of age can take the cards and do all the fitting and cutting of her dolls. And, by the way, a lot of dolls are on exhibition in the Pavilion, the dresses of which were cut out from these models. No lady should go away from the Fair without making herself acquainted with all the facts connected with the models; for, if she uses the needle, they are so cheap that she will be certain to want a set of them.

Heirlooms.—"Annt Susan" (Mrs. Lambert), manager-in-chief of the New England Kitchen, has placed on exhibition in one of the nooks of her cupboard, a gold watch, hull's eye pattern, double cased, which was made in 1746. The outer case is of tortoise shell, mosaic style, elaborately ornamented. This relic—so the descriptive card which accompanies it states—was worn by Miss Ann Knight on the occasion of her marriage to Ed. Gratwick, at Gravesend, county of Kent, England, in 1810. The same lady also exhibits an account book of General Andrew Jackson, inscribed on the fly-leaf, "Nashville, 181[illegible]—For the Orleans Brook Expedition." A memorandum on one of its pages will show with what particularity the old hero kept his accounts, to wit: "Mr. Harris took my mare to keep 2d August, 1814. Adam took her to work in the wagon 12th Oct., 1814. Took her back to Harris to keep Oct. 21st, 1814. Took her away Dec. 8th, 1814."

A Pretty Sign.—We rather think our editorial and publication office in the Pavilion boasts one of the prettiest signs at the Fair. When you call to get a paper, look up at it. The scroll symbolizes the parchment upon which it has heretofore been customary to write letters patent when they were issued to inventors. The hammer signifies an implement indispensable to the mechanic arts; and the pen, a weapon which, "beneath the rule of men entirely great, is mightier than the sword." Mr. Wm. Winter, 805 Washington street, is the artist.

Mr. Speaker Colfax visited the pavilion this morning, and took a quiet walk round. It was well for him that the "toadies" were ignorant of his whereabouts—although it might have redounded to the benefit of the Fair treasury—or there would have been a mighty rush and fulsome obsequious attention proferred him on the occasion.

Mutual Life Insurance Co.—So much has been said by way of argument—and incontrovertible argument, at that—in favor of life insurance, that no one has the temerity now to dispute the benefits arising from it. To leave his orphan children and the wife of his bosom provided for, after death, is, or ought to be, the desire of every right thinking man. This can be accomplished by taking out a policy in the Mutual Company, 609 Clay street, which is entirely responsible. Harry Homans, the polite and industrious agent, will take pleasure in explaining the details of the process, and the advantages arising from this kind of Insurance. We commend our readers to him for instruction.

Ban Spelling, or a Poor Joke.—A dish on one of the fruit tables in the Pavilion contains a lot of large pears, labeled "Vicar of Winkfield." The man who wrote the label either attempted to perpetrate a bad pun, or lives in ignorance of the works of Oliver Goldsmith.

Too Modest.—The author of those expressive statuettes in the art gallery, illustrative of scenes in the late rebellion, and modeled in clay, is by far too modest. The crowds who stop around his figures to admire them, invariably examine for the name of the sculptor without being able to find it. Won't he confer a favor on the public, and by so doing in a large degree enhance his own fame, and inform them by placard who he is, and where his studio may be found?

Unjust to Themselves.—Exhibitors of valuable inventions—particularly heavy machinery—who fail to have printed cards or descriptive circulars attached to their articles, do themselves a great injustice. The want of information of this kind, afforded to visitors and reporters for the press, deprives them of knowing, and placing before the public, the result of their investigations. As we have heretofore said, if articles are worthy of being exhibited, a few dollars expended in describing their merits, are sure to prove beneficial; and those who are negligent or too parsimonious to comply with this suggestion, will leave the Pavilion, at the conclusion of the Fair, without having derived any profit from its continuance.

J. & C. Schreiber have on exhibition a spiral-spring bed, for which a patent was issued on the 25th of October, 1864. The peculiarity of the patent consists in the mode of tying the springs, the springs being tied near the center downwards, making the bed firm and substantial, as well as elastic; from the center up to the top of the spring, separately, runs a cord which forms a brace to each spring, giving a softness which no other mode of adjusting can give. It is admitted by manufacturers and dealers, and others who have this new patent in use, to be superior to any spring-bed heretofore offered to the public. This exhibition is well worthy of examination by all those in want of a comfortable bed or other similar articles of furniture.

The Time to get Papers.—The circulation of the Daily Fair Press is gratuitous, and made entirely during the evening, at the Pavilion, where copies can be procured, but not thereafter, unless specially ordered beforehand. This explanation is made from the fact that frequent calls are made for the Press at the counter next morning.

Getting to Work.—Gradually the machinery in the northeast wing of the Pavilion, is getting into operation, and as each new piece yields to the propelling impulse of steam, and adds its hum and clunk and clatter to the general uproar, the scene is enlivened. In the intervals between the performances of the band, the music thus afforded, if it is not quite so accordant to the man of business, is hardly less rapturous.

Good Suggestion.—A city paper suggests, that the chairs round the fountain of the Pavilion were not put there for the especial accommodation of half-grown boys, who nightly occupy them, to stare the girls out of countenance. We concur in that opinion, and think they ought to be *moved*.

A Good Return.—The receipts of the New England Kitchen up to last (Friday) evening, were $2,304.60.

[From the Daily Fair Press, Monday, Aug. 22.]

A "What is It?"—Where's Barnum? His genius is wanted to classify a pen drawing in one of the art galleries, numbered 33. It is a beast, or fish, or fowl, or hybrid, or reptile, or insect, or something else belonging to the *animated* kingdom. But what? That "am" the question. It wears harness, and is "cavorting" in the shafts of a chariot, with Jupiter, Apollo, Castor, Pollax, Mars, or some other mythological character, holding the "ribbons" He is a warrior, *sure;* for, like Ajax, he holds a pitchfork in rest, and is defying the lightning! The name of the *beast*, however, is what we want to know. It is no weazel; but rather "backed like a whale." Will the author be good enough to tack under it a descriptive card, affording the necessary information?

Pacific Iron Works.—There was a time when California depended entirely upon the Atlantic cities for her machinery, and more particularly for her steam engines. But such is no longer the case. Goddard & Co., of the Pacific Iron Works, are now capable of furnishing every article demanded in this branch of industry. They manufacture quartz mills, amalgamating, pumping and hoisting machinery; flour, sugar, and saw-mills, water wheels, etc., and pledge themselves to erect them in perfect working order. The specimens of their work which we have seen are splendidly constructed.

Blue Ledge Rock.—A sample of rock from this ledge may be seen in our mineral collection at the Pavilion, which, although it shows but little gold to the naked eyes, is nevertheless said to be very rich. The company owning this ledge is incorporated under the name of the "Blue Ledge Quartz Mining Company," and is quite distinct from the Blue Ledge G. & S. M. Co., of this city. The richness of the rock warrants the expense of hauling it quite a distance for crushing. This rock is of a peculiar blue cast, hence the name of the ledge.

"The Florence."—The display made by Mr. Samuel Hill, agent of the Florence sewing machine, is highly creditable. This year the interest in all kinds of needlework is greatly hightened among the ladies. The "Florence" machine has its admirers, who of course, think it superior to all other sewing machines. It is certainly a beautiful and useful affair; but the ladies must decide for themselves when it comes to drawing comparisons between it and the other sewing machines on exhibition. With us comparisons would be *odorous*.

Roofing.—The gentleman in the picture, who, at the first glance, seems to be an urchin having a "good thing on ice," is a roof artisan, from the establishment of John Kehoe, 228 Bush street. He is closing up the seams of the tin sheets by machinery—a mode which is said to surpass all other plans of rendering roofs water tight. The proprietor, if called upon, will make the proper explanation.

Atwood's Windmills.—Among all the modern improvements since the days of the redoubtable Sancho Panza, none have been of more practical benefit to agriculturalists and horticulturalists, residing in places remote from running streams, than the windmill. To the people of the middle centuries, in its crude shape, it was an indispensable article; and to the moderns, in its elegant and simplified form of structure, it is equally an object of interest and utility. While it performs all the offices of a steam engine, it consumes none of the fuel necessary to that kind of motive power; but, catching the breeze from any and every point of the compass, uses it to dispense the aqueous blessings over the thirsty soil. A couple of fine specimens of the windmill manufactured by Atwood & Bodwell, 222 Mission street, may be seen in full play on the northeast corner of the Pavilion lot. They speak for themselves to all those who desire to procure such an article.

Gold Pens.—We believe Mr. W. B. J. Kenney's gold pens stand unrivaled in our San Francisco market. He boasts the possession of four first premiums as testimonials to their superiority.

[From the Daily Fair Press, Tuesday, August 22.]

FRAGMENTS OF THE "MONITOR" AND "MERRIMAC."

We have in our collection, at the Pavilion, small particles of the famous Monitor, Ericsson's first turretted ironclad, and her rebel antagonist, the "Merrimac." The first is an iron specimen and the latter pine wood—each singularly emblematic of the result and fate of the vessels and the powers they represented. The samples are from our excellent friend J. A. Heald, machinest in the Washington Navy Yard and leader of the *American Brass Band*.

The scrap from the Monitor is a portion of an iron splinter scaled from the plating by the heavy balls of the Merrimac. It was forwarded to us, by mail, at the time the former was being repaired at the Capital Navy Yard, after its wonderful engagement at Hampton Roads.

The wooden mite of the Merrimac is from a floating fragment picked up by the officers of the steamer Massachusetts, (directly after the blowing up of the defeated confederate craft by the rebels) and brought to the Navy Yard at Washington.

The Self-Adjusting Wringer.—In the economy of the kitchen there is no labor—not even washing—which requires the exercise of more strength, and is so straining upon the muscles, as clothes-wringing. This kind of labor, in most families, falls to the "help," or "maid of all work," whose wrists, in consequence, are red, and often peeled till the blood runs, after a hard day's washing. That is to say, this consequence arises when the hands and wrists are used for wringing instead of a machine, such as Swift's Patent, of which we are speaking, and of which M. E. Traver & Bro. are general agents. They claim for it great advantage over all other wringers, from the fact that it has the patent elliptical steel spring, which renders it self-adjusting and durable.

Rubber Clothing.—The uses which India rubber are made to subserve, under the development of modern science, are truly astounding. For proof of this, let the visitor examine the goods on the counter of the Rubber Clothing Co., in the Pavilion. A show-case adjoins, containing a lot of jewelry manufactured from the same material—a perfection of art which, even in this day of surprises, one would hardly expect to have seen.

How Long?—The question is frequently asked, "how long will the Fair continue?" It has become such a delightful place of resort that people are afraid it will close up too soon. We are not authorized to speak for the Managers, but hazard little in saying that it will run for at least three weeks yet.

Late Additions.—Exhibitors are evidently of the opinion that the Fair is to be an institution of long duration. They are still bringing in their goods, many of them heavy articles, and tell of their neighbors who intend to make their additions to the collection *some time next week!*

Golden State Iron Works.—This establishment is in the full tide of successful operation, 19, 21, 23 and 25, First street. All kinds of elegant machinery are here manufactured, such as quartz mills, steam engines, amalgamators, water-wheels, etc., etc., in a style of durability and with materials which suffer no discount in comparison with the best workmanship executed on the Pacific coast.

Cordage.—If a man wishes to hang, it is desirable that the cord he uses should be strong and without much tension. The same quality is necessary in the rope with which to make fast a steamboat, ship, a horse, or for whatever other purpose it may be demanded. Added to this, the consumer wants durability. Tubbs & Co., 611 and 613 Front street, think their cordage will "fill the bill." They offer it to the public in that confident expectation. Let those who have employment for the article try it.

Bad Orthography.—The gentleman whose title on his business card ranks him among the learned professions, might improve that word "difformity," if he would modernize its spelling a little. Our dictionary has it "deformity."

UNDERTAKING.—"After life's fitful fever" every man would desire that it might be said of him, "he sleeps well." In reference to bodily repose, this desideratum may be obtained by the relatives and friends of deceased parties for the deceased, if they will only call upon Nathaniel Gray, undertaker, 641 Sacramento street, corner of Webb. His caskets and metallic burial cases are superb, and a splendid hearse provided to haul them with their human contents.

A NEW CALIFORNIA PRODUCT.—Among the articles introduced into the Pavilion within a few days past, we notice several boxes of adamantine candles, which may be seen upon the left hand side of the main entrance, and near the door. These are the first adamantine candles of merchantable quality which have been produced in California, several attempts to make them having heretofore failed. These candles are pronounced by good judges fully equal to the best imported. They are manufactured by Wm. H. Scovill & Co., of this city.

WHATEVER affords security against the attacks of fire, must be an article high in popular favor. The fire-proof doors and shutters, manufactured by John R. Sims, afford this kind of security, and are therefore popular. He also manufactures balconies, bank vaults, gratings, railings, etc. Place, Oregon street, between Front and Davis, Washington and Jackson.

BRASS AND BELL FOUNDRY.—In the line of brass articles, Gallagher, Weed & White, 125 First street, have a full supply of their own manufacture. Bells and locks are specialties of their trade.

WILLIS' BAND, at the Fair, commences its afternoon performances at two o'clock. In the evening it commences at seven and a half o'clock.

AGRICULTURAL IMPLEMENTS.—John D. Arthur & Son are capable of supplying every demand in the line of agricultural implements. Their stock embraces the kinds generally in use, with all the modern improvements.

THE gross receipts of the Fair, from all sources, on Monday evening, amounted to $16,274.55.

THE receipts of the New England Kitchen up to and inclusive of Monday evening—deducting expenses—are $2,954.54.

[From the DAILY FAIR PRESS, Wednesday, August 23.]

THE SINGER SEWING MACHINE.—Two notable features of this beautiful machine, which may have escaped general observation, are, first, the folding cover, which when closed forms a box for the exclusion of dust and protection of the machine; and, second, the screws which adjust the frame to stand evenly on an uneven surface, and to force out the wheels or castors under it, to facilitate and render easy its removal to any part of a room. Of its numerous merits in the stitching department we do not propose to speak. The machine is vastly admired, and occupies high rank among its competitors for pre-eminence.

WARD'S SHIRTS.—The praises of Ward's Perfect Fitting Shirts" have been sounded everywhere. The proprietors, at 323 Montgomery street, ask only that they shall be tried to furnish the proof of their oft repeated declaration that they have no superior. "Cleanliness," it is said, "promotes godliness." Take a bath and put on one of Ward's perfect-fitters, ye sinners; godliness is a thing that ye all stand much in need of!

COMFORTABLE AND CONVENIENT.—The Superintendent of the Fair, (Mr. Gardiner Elliott,) has added greatly to the comfort of his guests by providing three of the art galleries with backed benches—two rows in the center of each room—so disposed as to face each way, and enable the ladies (lubberly boys and rude gentlemen will please observe that these seats have been specially provided for the ladies), to gaze upon the beautiful works of art with which the walls are adorned, while seated. Mats are also laid upon the floor to prevent the currents of air circulating through the cracks of the floor from making their feet cold.

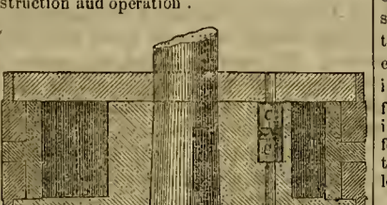
PRESSURE PISTON PACKING.

Among modern inventions in the manufacture and working of steam machinery, and they number legions, there are few which afford us more plain or self-evident economy than those relating to piston packing. Several patents for packing have been adopted into use during the past few years, which are claimed, with more or less merit, to make a decided saving in steam and an important increase of power to machinery. In fact, actual use has so thoroughly demonstrated the value of such improvements, that the most intelligent minds among our engineers now admit of no question in the matter further than that of "which is the best and most practical kind of steam pressure packing yet invented?

In answer to such an important interrogation, we are happily enabled to introduce the claims of a recent and highly worthy California invention.

STEVENS' PRESSURE PACKING

Was patented by the United States Government, March 7th, 1865, by Andrew Stevens, at present master mechanic on the Alameda and San Leandro Railroad. It is manufactured at the Vulcan Iron Works, on First street, in this city, the proprietors of which establishment have furnished us the use of the accompanying engraving and following description of its construction and operation.



Steam is admitted into the body of the piston through the small valves C, C, and by its pressure and expansive force keeps the rings steam tight against the cylinder without creating any undue friction. The valve on the steam side remains open until the pressure in the cylinder, either by expansion or exhaust, falls below that in the piston, when it closes, and the steam by its expansive force retains the rings against the cylinder to the end of the stroke, when the action is again repeated.

Among many advantages claimed, is

1. Absence of friction of the rings on cylinder, proven by the tool marks remaining on the cylinder after six months constant running.

2. The retention of the steam inside the piston by means of the two valves—thereby preventing waste.

3. The steam being of the pressure inside of the piston as it is outside—the piston may overrun the counterbore without damage, and thereby prevent a ridge being formed in the ends.

4. The body of the piston fitting the inside rings, keeps the piston always in the center of the cylinder.

5. The increased ring surface, which wears much longer than narrow ones.

It is not only the saving in steam and fuel which lends importance to this invention. The economy in the cost of machinery for a given amount of power must be equally great, as also the benefit to be derived from the concentration of power into small space and weight. Space is a great consideration in the running of our steamers, for time is money. If the machinery can be lightened, and its power increased in our river steamers, the delays of mud flats and "hogsbacks" will be dispensed with. Such are among the advantages which will be secured in a greater or less degree, by the application of the most perfect pressure packing. The proprietor of Steven's packing refers with great confidence to many prominent parties who have tested by thorough application this most useful invention. Engines using it have been running from three to twelve months without being opened or exhibiting any leak.

THE SPELLING SCHOOL.—Our anticipations were fully realized in predicting for that performance last night, in the New England Kitchen, a great display of wit on the part of the actors, and enjoyment to the audience. The latter was unusually large; and their frequent outbursts of laughter indicated how hugely they enjoyed the entertainment. Jonathan "laid himself out." He was felicitous to the extreme point of superlative admiration! The apron became him; and the part—that of the village dunce, meddlesome and mischievous—was more life-like than anything he had previously essayed. But Zeke, where was Zeke? We missed his familiar countenance, and sighed that he should be absent from duty. It was in vain that the ferocious looking whiskerands in scarlet breeches, and the sallow faced youth with the small voice and soup-locks attempted to supply his place. They were deficient in jest. Their lessons had not been sufficiently conned. In fact they were not like Zeke, blessed with "genus." Old Poffendorff, the pedagogue, was kept busy. He wielded the birch gracefully, but allowed Jonathan and his modesty to embarrass him to much. But, as the theatrical critics say, "familiarity with the stage business will remedy that defect." To-night an old-fashioned "donation party" is to be held for the benefit of the village parson. Jonathan will be on hand, and Zeke also, if the management are successful in effecting his re-engagement!

THE HANSBROW PUMPS.—Mr. Thomas Hansbrow, of Sacramento, is acquiring great reputation as an inventor. He is the "Ericcson" of the Pacific coast. At the last World's Fair in London, he carried off the gold medal for one of his model pumps. This year he has several specimens of the same on exhibition at the Pavilion, of great merit. His hydrostatic engine, alone, ought to have rendered his name immortal among inventors. We regret, therefore, that he should degrade himself by becoming a candidate, as he has done, for the California Legislature! He ought to be old enough to know that it is the *first step* in crime that leads to destruction!

HANDSOME PICTURES.—This morning, Mr. F. L. Tilston, agent for the Wheeler & Wilson Sewing Machines, brought up from his office to the Pavilion four beautiful paintings—three in oil and one in water colors—which were assigned a conspicuous place in one of the art galleries. Two of these pictures are views of Lake Tahoe; one of Yosemite, and the fourth a group of pretty girls, which the bachelors will not fail to admire.

NEW ENGLAND KITCHEN.—Visitors are beginning to resort to this institution as a place of amusement where the entertainments are sprightly as the play. The characters each evening are cast; and although the parts are not studied, there is a native wit about the girls which imparts to their impromptu actions and utterances a zest at all times acceptable to the audience. As to Zeke, he so far outstrips Setchell, that the latter has failed to "draw" since Zeke donned the sock and buskin. Zeke is the twin prodigy to Bottom—always fresh; always hilarious; never at a loss for an antic or a sally. Pity the theatre *comique* should have lost the benefit of his transcendant powers!

And Jonathan! Of course you have noted Jonathan's tricks. His versatility surpasses Dogberry's; his gravity and wisdom that of the First Grave Digger in Hamlet. Jonathan is bully! his costumes are from the establishment of Mm'lle Termy, selected with rare discrimination, and varied to suit the *role* in in which he is to appear. If we were going to produce an original comedy, and were in London, or any other part of Europe, we should certainly employ the Atlantic telegraph (if it were operating) to send a dispatch, securing the services of these brilliant performances for an engagement!

Aunt Susan announces that her programme will, this evening consist of a spelling school, singing and dancing. (You must hear Zeke and Jonathan spell; they are "stars" in such parts.) To-morrow evening there will be a "donation party" for the village parson, and other amusements. Jonathan and Zeke, as usual, sustaining the leading characters.

BIRD'S EYE VIEW.—Visitors to the Pavilion can enjoy a very interesting bird's-eye view of of the audience and articles on Exhibition in the main hall, by ascending to the elevated platform on the north side, which has the capacity to accommodate nearly a hundred persons at a time, and where seats have been provided for the comfort of ladies.

LAYNE G. AND S. M. CO.

This company own one of the earliest discovered, and one of the finest silver mines in this State. The mine is situated in Placer County, about four miles from Folsom, and is easy of access, having on this account a great advantage over the more distant and famous mines of Nevada. Mr. Layne has just shown us some bricks of gold and silver bullion from ore from this mine. One lot, he informs us, of 1,900 pounds of second class ore from this mine, worked at the Pacific Metallurgical Works, in this city, gives $36 in silver and $16 in gold, while a lot of third class ores, worked at the same establishment, gives us a result, $20 per ton in silver and $10 in gold. One hundred pounds of first class ore, worked at the San Francisco Foundry, yielded at the rate of $95 per ton in gold and silver, the latter predominating.

We are of the opinion that this mine, taking into consideration the large body of pay ore, the paying portion of the vein being represented as ten feet in width, and its ease of access, will, provided it continues to improve at the rate which present appearances would seem to indicate, prove of more real value than any of those located on the famous Comstock.

The particular attention of visitors is requested to the specimens from this mine, in the collection at the Fair, including the first silver brick from ore from this mine, which Mr. L. claims as the first ever obtained from a California mine.

BOOK BINDING.—None of the mechanical arts progress more rapidly than book-binding. Twenty-five years ago the process was almost as tedious as book printing; but the numerous improvements in machinery adapted to that kind of labor have vastly simplified, economized and perfected it. A glance at the elegantly bound books turned out of the establishment of Edward Bosqui & Co., 517 Clay street, affords evidence of the skill with which this machinery can be applied. The ledger and day book, the annual and souvenir, the speller and Bible, after undergoing the manipulations to which they are subjected in the establishment of these gentlemen, become equal objects of ornamentation for the desk, the centre-table, or library.

A. ROMAN & Co.—The fame enjoyed by this publication house is becoming national. It is a vast library, in which may be found all the standard works and light literature of past and current dates. As yet, the amount of publishing done on the Pacific coast is not very great. We have hosts of writers, but not many authors; and those that we have scarcely venture so far as to produce a book. However, there will be an increase of this kind of mental labor as the country grows older; for neither is there any lack of the *cacoethes scribendi*, nor a deficiency in that kind of ambition which would signalize itself at book-making if it could be an insured success. In the meantime, the book trade, so far as reading is concerned, can be amply supplied by the prosperous house to which we are alluding.

AXLE GREASE.—Hucks & Lambert are known on this coast, where a wheeled vehicle has gone or a dry hub creaked. Their celebrated axle grease has moistened the running gear of many a "prairie schooner," and, it is said, of late years is becoming equally famous as a lubricator for machinery. Shouldn't be surprised. Lightning itself travels faster when it is *greased*.

FIREMAN'S FUND INSURANCE CO.—The capital stock of this company is $500,000. Those who insure in it have the satisfaction of knowing that their money goes to the support of a very worthy object. Its office is at 238 Montgomery street, and its affairs under the immediate control of S. H. Parker, President, and Charles R. Bond, Secretary.

A BUTCHER at Lyons has just been fined ten francs and costs, for weighing with a piece of meat the paper with which it was to be enveloped.

[From the Daily Fair Press, Friday, August 25.]

THE FAIR A SUCCESS.

There were a number of reasons operating to raise a doubt in the minds of the managers, as to whether the Industrial Exhibition of the present year would prove as great a success as those of the past. In a new and comparatively thinly populated State, isolated in its position with reference to other States of the Union, the number of inventors must necessarily be limited, and without something new each year of this kind to draw and interest the attention of the industrial masses, a chief feature of attraction at such places is wanting, not to be supplied by the ten thousand minor products of ingenuity, such as add beauty and brilliancy to a collection, without carrying with them the utility belonging to devices of the higher order of genius. The most celebrated works of art, and the most skillful inventions, had already been exhibited, which led to the presumption that they might not again be placed in the Pavilion for public inspection. The transportation of heavy machinery, its erection, the attention and material necessary to show it to advantage; the expense of removing it from the hall when the Fair is over; the stringency of the money market, and other causes, all combined to justify the apprehension to which we have alluded; and yet, despite these adverse considerations, the Fifth Annual Fair of the Mechanics' Institute compares very favorably in all its features, excepting only the heavy machinery department, with that of last year, which excelled by long odds those that had preceded it. The receipts promise to be much larger than those ever heretofore received.

As a place of fashionable resort, the Pavilion has many inducements, which the young folks have not been slow to discover. The nightly attendance of this portion of community is very large, and that they are abundantly satisfied with the nature of the entertainment offered, is rendered apparent in the fact that hundreds if not thousands of the same faces are repeatedly seen by those who make their constant promenades around the spacious hall.

There will not probably be another Fair held under the present auspices for several years to come. The object which the members of the Mechanics' Institute had in view in first inaugurating the project, was to pay off a large debt of their society. The proceeds of the present Fair will enable them to have accomplished that purpose, and in addition, to purchase a lot for the enlargement of their premises, besides increasing the number of books in their library. After the Fair has closed, the building in which it is held will be taken down. This may be regarded as a foregone conclusion, inasmuch as the residents in that portion of the city object to it as an unsightly incumbrance to the lot which has been set aside by the city and devoted to the purposes of a public square. The last opportunity, then, for a long time to come, is offered to those who wish to examine the collected works of art, science and invention of the State, and in so doing patronize a most laudable and worthy object. The pittance expended for admission will be a thousand times repaid in the valuable nature of the information acquired.

Russ House.—This extensive hotel, the largest in the State, has always enjoyed an excellent reputation in the interior as well as nearer home. The change of proprietorship which occurred only a few weeks ago, has had the effect to add to, rather than diminish, the measure of its popularity. Mr. Pearson was formerly himself a landlord, in Nevada county, with a wide and favorable acquaintance. The mountain people therefore hold him in kindly remembrance, by patronizing him when they come for a brief sojourn to the city. The Russ House is on Montgomery street, in a central portion of San Francisco, easy of access, and must always receive its full share of the public patronage.

Dead.—The other evening a death occurred in the Pavilion of the Fair; the first, as we hope it may prove the last and only one of that institution. It was the death of the large sturgeon, which had only a few hours previously been placed in the basin surrounding the fountain.

A New Art.—Major Jack Stratman, of the news depot, brought out from New York with him recently, and has placed in the Fair for exhibition, several specimens of a new art—or rather, an old art with a new application—of photography, by which likenesses are transferred from the card to china, porcelain or white delph ware, and is rendered as durable as the colors originally imprinted there by the manufacturers. Major Stratman is exclusive agent for the patentees on the Pacific coast. A lady owning a valuable set of china, or a father wishing to make a holiday or birthday present to his children in the shape of a cup, at a trifling cost can have the likeness of either the donor or owner, or both, transferred to each separate piece, as the best and most elegant style of obtaining for it identity and recognition.

Which Should Apologize?—Last evening, in his attempts to elbow his way through the crowd in one of the avenues of the pavilion, a gentleman stepped upon the trail of a lady's dress, tearing her skirt loose from a portion of its waist fastenings. With as much dexterity as he could possibly command in so contracted a space, he attempted to get off the lady's dress, but in doing so, trod upon that of a second lady, tearing it also, tripping and falling with his side against one of the tables, by which he was severely, although not seriously injured. The ladies looked daggers, and muttered something which the gentleman could not understand, on account of being at the time himself engaged in the mental exercise of combining a variety of expressive phrases, which were better, perhaps, suppressed than uttered. Now, the question arises, who was at fault? Gentlemen have *some* rights on the sidewalks, in the street cars, and at places of public amusement. If the ladies *will* wear their skirts long enough to bedraggle, to sweep a track through the dust, and be trodden upon, can the gentlemen help it?

A Valuable Invention.—The new binder for sewing machines, invented and lately patented by Mr. George Vincent, of Stockton, is a most ingenious and useful appendage to the little iron-armed workers which at the present day take such active part in lightening the labors of our households. It can be seen in the Florence department of the Fair, the inventor having so far particularly adapted them to this machine, which we suppose, until we saw the new binder, embodied within itself all that the ingenuity of man could produce, or the heart of woman desire in a sewing machine. One binder, without change, puts on binding of various widths with the greatest ease and rapidity and in a perfect manner. The bottom of a dress can be bound in three minutes, and what ever kind of binding used, it is put on without being drawn or stretched in the operation, which is the great feature of the invention, and will be understood and appreciated by those who have attempted to do good work with the imperfect contrivances heretofore used for the purpose. This new invention, when compared with the thousand and one appliances that have been patented for sewing machines, must rank next to the sewing machine itself, in utility, as no sewing machine can now be considered complete without the "Vincent Binder." We congratulate Mr. Hill on having secured this valuable addition to his popular machines.

Boots and Shoes.—Reader! have you ever considered what a vast number of boots and shoes must be worn out annually in a city of a hundred and twenty thousand souls—two hundred and forty thousand *soles!* The little people must have a pair about once every month. It affords them delight to knock the toes out; and the grown folks use up three or four pairs a year. Such a vast demand necessitates an immense supply, such as Wm. F. Burke, importer, corner of Montgomery and Pine streets, keeps always on hand, boxed for home demand and shipment. He thinks he is equal to any run that is likely to be made upon him, so that jobbers and country merchants need have no apprehensions of suffering for a supply. They have the hint, and will know just how to act upon it.

Trunks.—The developments of modern science, no less than the practical experience of modern cosmopolitans and travellers, furnish evidence to sustain the declaration that "the dearest article is the cheapest." Who that has paid five dollars for one pair of boots, for instance, and fifteen dollars for another, has not found that the cheap pair are manufactured from some inferior article, and go all to pieces when subjected to some severe test, and that the pair which was considered dear, exhibits no signs of dilapidation when the others are entirely worn out. Nothing demonstrates the axiom more truly than a trunk. Such an article, composed of side or sole leather, will last a life-time; the cheap trunk is used up in half a dozen stage-coach excursions. Ask Mr. James Longshore, 208 Bush street, or 306 Sansome street, if this is not so.

The House of Field & Co.—This firm has only recently opened up at the corner of California and Leidesdorff streets, No. 422. It is an importing house of wines, brandies and other liquors. Mr. S. S. Field was formerly a partner in the well known house of Despecher & Field, Sacramento. He gives his personal attention to the business, and is a gentleman with whom every one will find it a pleasure to deal. The house pays particular attention to filling out orders for clubs, social parties and families. We heartily commend it to popular favor.

A Crowded Audience.—A vast multitude of people were in attendance at the Fair last evening. The spacious hall of the pavilion was crowded so that it was difficult to get along, and the New England Kitchen was literally jammed with people.

Articles Found.—It is perhaps not generally known that most, if not all the articles lost in the pavilion of the Fair, are picked up and carried into the office of the clerks, where they can at any time be procured. The collection of articles already deposited there for identification is quite large, and includes ladies' kid gloves, children's woolen gloves, children's scarfs, neck-ties and comforters, ladies' veils, head-dresses, laces, kerchiefs, etc.

The Blue Ledge.—Number 490, in our cabinet of minerals, is a lot of rock from what is claimed to be the genuine Blue Ledge, in El Dorado county, which, by the way, should not be confounded with the Blue Ledge company incorporated in this city. This rock although it does not show much gold to the eye, is nevertheless very rich. We have seen a letter from the superintendent, dated Spanishtown, August 17th, saying that he had just put in a heavy blast which threw down a large mass of rock literally filled with gold. The rock thrown out by this blast is of a darker hue than the previous average, showing more sulphurets, and giving indications of much richer yield.

New Use for a Soda Fountain.—Mr. Frink has claimed for his recent improvement on the Soda fountain, that he could make it propel machinery; and to redeem his word has introduced on his counter, in the Pavilion of the Fair, a neatly constructed miniature steam engine, with a pipe attachment to his apparatus, and when the gas is let into its cylinder the motion of the machinery is rapid and perfect. The fountain itself has, from the beginning of the Fair, been a great object of attraction, which is now vastly increased by this new and novel feature.

Scene in the Clerk's Office at the Pavilion.—Enter gentleman, inquiring of J. H. C., "Can I get a card here with "Hands Off?"

Clerk.—"*A hand saw?*"

The roar of laughter that followed convinced J. H. C. that he had been slightly mistaken in the nature of the question.

Proceedings at the Pavilion.—This afternoon, at three o'clock, Hon. Schuyler Colfax and party were present, as per appointment, at the Pavilion of the Fair. A meeting was organized, with Mayor Coon as Chairman, which was addressed by Mr. Colfax, Lieut. Gov. Bross, of Illinois, and Mayor Coon. About 1,500 persons were in attendance. The ladies of the New England Kitchen occupied a seat in front of the rostrum, dressed out in their characteristic array.

THE ATLANTIC TELEGRAPH CABLE.

On the 24th of June the Great Eastern, according to advertisement, steamed out of the river Medway, and proceeded to the anchorage selected for her at the Nore, from which point she would sail for the purpose of laying down the Atlantic Telegraph cable, about the 8th of July. All the arrangements for the accomplishment of the work had been made with such care and foresight that it was hardly thought possible there could be any failure, unless from the intervention of a severe storm, which might break the line and scatter the fleet engaged in laying it. They were looking for intelligence at New York, on the 25th of July, that the work had been successfully completed.

The Great Eastern had in her 7,000 tons of cable; 2,600 miles in all; 500 miles more than, with good luck, would be wanted. Add tanks, coal and engines, and the burden of the ship would be 21,000 tons, 3,000 less than her tonnage capacity. For convoy she had two British ships of war. Our Government was applied to for the loan of a national vessel, but replied with dignity on the ground that vessels of the United States were still subject to restrictions in leaving British ports. Valeutia, on the coast of Ireland, was to be the starting point; Heart's Content, Trinity Bay, Newfoundland, the destination of the telegraphic fleet. But the Great Eastern would not approach Valentia nearer than 25 miles, and would there splice the ocean cable with the shore end previously laid. On this side, the deep sea cable would reach to within three miles of the shore, and at that point be spliced. From Valentia, the shore end would be the heaviest and strongest piece of cable ever made, weighing per mile about half as much as an ordinary railway track. It was to be laid from the head of a sheltered inlet near Cahirciveen, and the sea end buoyed and watched by the ships of war till the Great Eastern came up. The splicing of it with the end of the main cable would be a matter of five hours' work, and when that was done, the voyage of the ships and paying out of the cable would fairly commence. The telegraphic charges were to be £20 per twenty words.

Good Idea.—It is stated that in Maine there is a law which allows a certain reduction of taxes to each man who will put up, and keep in good condition and well supplied, a trough or tub for water, on any public roadside. A reduction of taxes is also made for those who will plant and raise shade-trees alongside of the highways. Three dollars a year is the amount deducted for the water arrangement, and a certain sum is deducted for each tree grown. It would be a good thing to adopt similar statuary regulations in this State. A little encouragement of this sort would induce farmers everywhere to plant trees on the roadsides, and soon cooling shades would spring up to destroy the monotony and discomfort of our dry, dusty, and shadeless highways.—*Call, June 16th.*

Origin of Stockings.—The stockings worn by the ancients consisted of strips of linen, or of the skins of animals. The Normans wore them made of cloth, or of costly stuff, embroidered and decorated with gold and silver. Knit worsted stockings were imported first in the time of Henry VIII., and were worn by the gentry of that period; and in 1530 a pair of silk stockings was sent to that monarch from Spain. In the time of Queen Elizabeth it was common for young men of rank to wear stockings of different fashions and different colors on each leg. In 1561 the first pair of silk stockings were knit in England, and were presented to the Queen. About the same period the method of knitting worsted stockings was brought to that country. In 1859 a machine for weaving stockings was introduced by Wm. Lee, and this laid the foundation of the extensive stocking manufacture now carried on in England.

Mountain Quail.—Natural History.—Our friend, Sam Hodge showed us some young mountain quails which he saw coming out of a nest in an oak tree, on his ranch from a height of about twenty feet. They were but recently hatched, as a few had the shell on their backs when they alighted on the ground. They spread their wings as they emerged and let themselves down to the earth with ease and comfort. The mother remained in the tree. This is a somewhat remarkable circumstance, as quail generally hatch on the ground.—*Grass Valley National.*

HEAVY SHIPMENT.—We saw yesterday at the office of Wells, Fargo & Co., in Gold Hill, twenty-seven bars of glittering bullion awaiting shipment to San Francisco. The value of the same was $39,677 52, and its weight 1,414, pounds. For several weeks our shipments of bullion have largely exceeded those of Virginia, owing probably to the fact that we have established in our midst the finest assaying

BEAUTIFUL EXTRACT.—When the summer of youth is slowly wasting into the nightfall of age, and the shadows of the past years grow deeper and deeper, as if life were on its close, it is pleasant to look back through the vista of time upon the sorrows and felicities of years. If we have a home to shelter and hearts

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Ulotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

MEDICINE DELIVERED TO ANY ADDRESS.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
S. P. KIMBALL, J. R. MURPHY.
10v10

NOTICE

COMMERCIAL COLLEGE,

LOCATED AT SAN JOSE, CAL.

MALE AND FEMALE.

The next session of this Institution will commence on

Monday, July 31, 1865.

An experienced and competent BOARD OF INSTRUCTION is engaged, and every facility will be afforded for a thorough course of study, both in the Academic and Commercial Departments.

Catalogues, containing full particulars, furnished upon application to F. GATES, Director,

25v10-3m San Jose, Cal.

BLASTING

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder ompany.

EUREKA

PATENT BLASTING POWDER,

Price $3.50 Per Keg.

Office, southeast corner Battery and Commercial streets.

Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 2v11qy

PREMIUMS.

1st Premium, at Sacramento Fair.....1862

1st Premium, at S. F. Bay District....1862

1st Premium at Sacramento.....1863

1st Premium, at San Francisco.....1864

1st Premium, for Cordials.....1864

1st Premium, for Hygienic Bitters....1864

LEWIS COFFEY. J. S. RISDON

LEWIS COFFEY & RISDON,

Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

PORTLAND BOILER WORKS.

MOYNIHAN & AITKEN,

BOILER MAKERS AND SHEET IRON WORKERS.

N. B.—All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms.

Mission street, between Beale and Fremont streets, San Francisco. qy29-1

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

Machinists and Foundries.

H. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines,

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Fine, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Belding's pan, Veatch's tubs, Prater's concentrators, Wahlee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or Iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices.

—ALSO—

Wine, Cider, Cotton and Tobacco Presses of the latest Improved Patterns.

Brodie's Improved Patent WIND BLAST SEPARATOR, for Dry Crushing; Salmon's Patent Amalgamator and Separator; Wheeler & Randall's New Grindor and Separator; Baux & Guiod's Amalgamator and Soparator; W. W. Tuppor's Patent Sectional Grate Bar; Coal Oil Well Boring Machinery complete, on hand.

STEAM ENGINES AND BOILERS,

Of all sizes, constantly on hand; Quartz Mill Shoes and Dies warranted to be made of the best white iron.

MACHINERY, OF ALL DESCRIPTIONS,

Bought, sold, or exchanged. Bolt Cutting and Castings, at the lowest market rates. 6v11-1y

DEVOE, DINSMORE & CO.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR

BETH'S AMALGAMATOR;

HERSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;

BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;

FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;

JONVAL'S IMPROVED WATER WHEEL;

STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fenco Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

[From the Mining and Scientific Press, Thursday Aug. 24th.]

NEW ENGLAND KITCHEN.—Last evening a gayer spectacle was presented in this institution, with a larger number of performers to take part, and a more crowded audience to witness it, than has yet occurred in the kitchen. There were no less than forty ladies and gentlemen on the stage at one time, two-thirds of whom were ladies, representing, as the "chiv." would say, "our first families," and gentlemen representing the bar, judiciary, medical, mercantile, mechanic, and several other professions. A spirit of emulation seems to have been created, which is leading to an extravagant display of dress. The apparel of both male and female actors was grand and costly. The ladies were "furbelowed," belaced, bedizzened, powdered, painted, frilled, muffled, and otherwise "rigged out" in forms as various as the customs of at least three centuries in the sliding scale of the past ages would admit. The gentlemen had evidently been ransacking among the wardrobes of the theatricals, and depleting the shelves of M'lle Terme, to obtain costumes for their various parts. Among the characters of the *dramatis personæ* were counts, marquises, knights, barons, bishops, barristers, Spanish Dons, hidalgoes, parsons, pedagogues, gentlemen and sailors. "Big wigs," puffed wigs, and queued wigs flourished in all the splendor of gay ribbons and powder. Gen. Lafayette was personated, and other historical characters, whose titles, notwithstanding diligent inquiry, we were unable to ascertain. Jonathan was in an entirely new character—that of a minister, or curate, or some such respected personage, and had furbished up his wits, and summoned to his aid all the courtly graces of a Chesterfield or Count D'Orsay. He was the cynosure of all eyes—the focal point of attraction—around whom the ladies gathered, and to whom the audience looked for the utterance of wise saws and sparkling sallies. Jonathan was not only like Barkis "willin'," but also like Brutus, an orator and eloquent. The kitchen stage produced no performer that could rival him. Zeke was in a new wig. He wore a cocked hat, tight and velvet breeches, shoes with buckles, a powdered wig with a long queue, breeches of plush, a grey whisker that enveloped most of his face, and looked the courtier for all the world, as he intended to. But Zeke was lame, and consequently flagged in the acting department. Positively, the inmates of the kitchen are getting into the "heavy" line. The next thing we shall look for will be the regular play.

MUSICAL.—Mr. Willis informs us that on Saturday night, at half past nine, Mr. Kendall, the justly celebrated clarionet player, will favor the visitors of the Fair with a choice solo, which will contain the "Last Rose of Summer." The audience will confer a great kindness if they will keep perfectly quiet during this solo, as the Pavilion is so large that the soft passages of music cannot be heard when people are moving and talking. There will be a number of beautiful selections from operas, also. Mr. Willis deserves credit for his energy in trying to make his music one of the attractions of the Fair.

A SHOCK.—The immense leather belt used on the splendid steam engine from the Union foundry to propel the machinery at the pavilion, broke and slipped from its drum last night, falling to the floor with a crash. The room was filled with ladies and gentleman at the time whose nerves sustained a severe shock, succeeded by a grand scamper. There was a good deal of interest and inquiry for a few moments to know "what was the matter." When the facts were ascertained, and nobody found to be hurt, engineers went quietly to work, repaired the band, and soon had the machinery again in running order.

ACCIDENT.—A letter from superintendent T. G. Duff, of the Paragon Petroleum company, Mattole district, Humboldt county, states that in erecting the derrick for boring apparatus, a flaw in the timber gave way and precipitated one of the workmen down a distance of 40 feet. Fortunately he was not killed, although it is feared he is internally injured. But for this accident, boring would have been commenced on the claim on the 15th. The delay will probably be but for a few days.

RECEIPTS OF FAIR.—The receipts of the Fair up to and including Wednesday evening, were $18,128.

Mining Notices--Continued.

☞ *New Mining Advertisements to be found on another page.*☜

Baltimore Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Saturday, September 16th, 1865, at 10 A. M. of said day.

au12-4w J. WARREN CLARK, Secretary.

Bolinas Petroleum Co., Bolinas Township, Marin county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of August, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 16th day of August, 1865, in United States gold coin, to the Secretary, 611 Clay street, Room 8, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 2d day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. L. KIRBY, Secretary.

Office, 611 Clay street, San Francisco. au19

Chloride Ledge Gold and Silver Mining Company. Location of Mine: Blue Mountain District, Calaveras county, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the 11th day of July, 1865, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Boothby, W L	bal due on	2	40	$25 00
Crowell, G E		14	20	20 00
Hayden, John		7	20	20 00
Reynolds, R T	bal due on	3	30	15 00
Schultze, R	bal due on	0	50	20 00
Williams, Franklin		27	5	5 00

And in accordance with law, and an order of the Board of Trustees, made on the 11th day of August, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the auction salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 21 day of September, 1865, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. H. SMITH, Secretary.

Office, No. 606 Montgomery street, San Francisco. au19

Camargo (Eclipse) Gold and Silver Mining Company, Reese River Mining District, Lander county, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 17th day of July, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Allen, H H	46	9	$45 00

Office, 55 Montgomery Block, San Francisco. au19-3w

Smoky Valley Gold and Silver Mining Company, Smoky Valley District, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment No. 7, levied on the 10th day of July, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Joseph Rydberg,	108	2	$ 3 00
G H Mullen	111	10	15 00
G H Mullen	112	10	15 00
James D Sears	113	10	15 00
James D Sears	114	10	15 00
James D Sears	115	10	15 00
James D Sears	116	10	15 00
James D Sears	117	10	15 00
C A Waller	128	5	7 50
S S Phillips	161	10	15 00
S S Phillips	190	2	3 00
James Hawley	not issued	30	45 00

And in accordance with law, and an order of the Board of Trustees, made on the 10th day of July, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at Maurice Dore & Co.'s, No. 327 Montgomery street, San Francisco, on Wednesday, 30th day of August, 1865, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. W. KNIGHT, Secretary.

Office, No. 36 Exchange Building, San Francisco. au12

St. Clair Consolidated Mining Company, Smoky Valley District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 31st day of July, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 16th day of September, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

AUGUST KUNAST, Secretary.

Office, 540 Washington Street, au5

Silver Prize Gold and Silver Mining Company, Silver Mountain District, Alpine county, California

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Wednesday, September 20th, 1865, at 2 P. M. of said day.

au12 4w J. WARREN CLARK, Secretary.

Scott Mining and Exploring Company, Humboldt county, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of August, 1865, an assessment of eighty (80) cents per share was levied upon the capital stock of said company, payable immediately, in United States coin, to the Secretary, at the office of Irvine & Co., No. 224 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 9th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 25th day of September, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

V. B. POST, Secretary.

Office, No. 224 Front street. au12

Tip Top Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Monday, September 18th, 1865, at 12 M. of said day.

au12-4w J. WARREN CLARK, Secretary.

Office of the United States Gold and Silver Mining Company, San Francisco, Cal.—Location of Mines: In Santa Fe and Ravenswood Mining Districts, Lander county, Nevada.

Notice is hereby given, that in accordance with a resolution of the Board of Trustees of the above named Company, passed on Wednesday, the fifth day of July, 1865, and in accordance with the by-laws of said Company, a meeting of the stockholders of the above named Company will be held at the office of the Company, No. 605 Clay street, in this city, on Thursday, the tenth day of August next, at 7½ o'clock P. M., for the purpose of authorizing and empowering the Trustees of said Company to sell on or more of the mines belonging to the said United States Gold and Silver Mining Company, and for the purpose of changing the by-laws of the same, and for the transaction of any and all business that may legally come before the meeting. By order of the Board of Trustees.

T. L. BIBBINS, Secretary.

San Francisco, July 5, 1865. jy8 5w

The above meeting is hereby adjourned to the 24th inst., at the same hour and 540 Clay street. By order of the Board of Trustees.

au 12 J. T. PENNELL, Secretary pro tem.

au12-4w J. WARREN CLARK, Secretary.

Wide West Gold and Silver Mining Company, Silver Mountain District Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Tbursday, September 7th, 1865, at 2 P. M. of said day.

au12-4w I. S. BROWN, Secretary.

PERPETUITY OF THE AMERICAN GOVERNMENT.—The history of the other Republics bears no parallel with ours. Their destructive expansion gives no warning admonition in the American horoscope. Panting caravans and slow-marching columns are not here required for the government of distant provinces. as they were in the era of Cæsar, or even when Napoleon drew his maps of conquest in the shadows of the Pyramids. Steeds feeling no weariness leap along parallels of iron, and couriers animated by the lightning, have taken the place of the sweating "ships of the desert' and the swift runner who carried the proclamation of Alexander to Cyrus. A tumult in Athens or a conspiracy in Rome now disturbs a thousand iron nerves, and arms a continent.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinklied.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-qy

OIL WELL BORING.

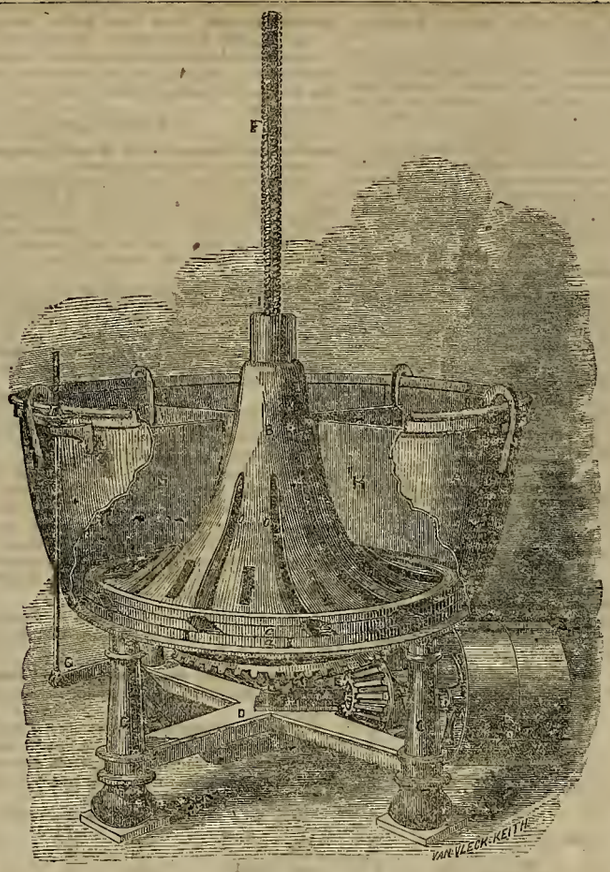
The claims of this Company consists of SIX HUNDRED AND FORTY (640) ACRES, situated on Kellog Creek, in the Marsh Creek Mining District, Contra Costa county, Cal.

One thousand (1,000) shares of the contingent fund is offered at the low price of ONE ($1.00) DOLLAR per share, full paid, all the stock being unassessable. All who wish to purchase, or make any enquiry concerning the Company, will please call on the Secretary,

J. M. BUFFINGTON,

2v11 Corner of Sansome and Washington streets.



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity, "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

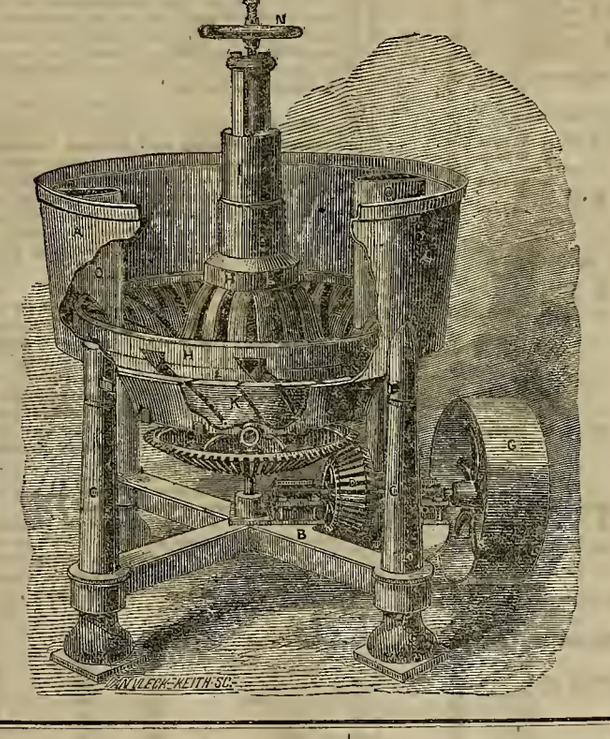
Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.



THE WHEELER & RANDALL Grinder and Amalgamator.

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plutes, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSIT ON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Componnd For Sale

That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Machinery.

ATTENTION, MINERS!

LINSCOTT'S PATENT
CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¾ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fancher's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Cascadile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

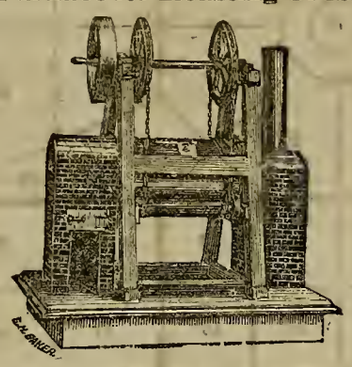
B. Fancher and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, calculate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works. No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FANCHER, Engineer,

24v9

WM. BRUCKNER'S
Furnace for Roasting Ores.



Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, underrakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating raises and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,
5v10 No. 416 Market street, San Francisco.

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned.

Address,
BLAKE & TYLER,
Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to milling on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

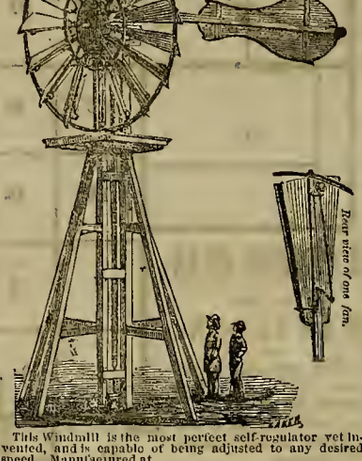
PRICE,.....$800.

Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.
21v10 RIX & LOGAN.

ATWOOD'S
Self-Regulating Windmill.



Rear view of one fan.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER
For Sawing Wood,
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

LEFFEL'S
AMERICAN DOUBLE TURBINE.

The DOUBLE TURBINES, so long expected, have arrived at last, and orders can now be filled. We have a large supply of the different sizes, from 20 inches to 90¾. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

The above Wheel will be exhibited during the Fair of the Mechanics' Institute, where all may see it and hear its merits explained. This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,
4v11-tf Care RICHARDS & MCCRORKEN, San Francisco.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

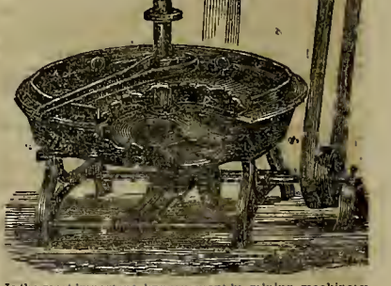
This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-3tf

A GROUND PLAN

OF THE

PAVILION.

The engraving represents the space in the Grand Pavilion marked out and numbered into sections for conveuience of reference.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervences, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prosirated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the sys tem from this stnte of misery. Two or three doses will convince the afflicted of their sulutary influence. The stomach will speedily regain its strength, a healthy netion of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and re newed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

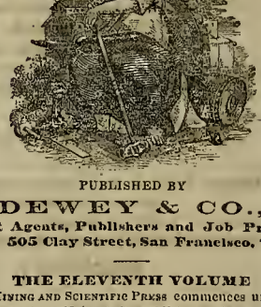
New Volume

—OF THE—

Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).



PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers,

505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

☞ ROUND VOLUMES FOR SALE. ☜

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes) $5.00

Six Months, (one volume) 3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

OBITUARY.—We are pained to announce the death of Mr. Edward Daniels, Impost Clerk in the Custom House, by the upsetting of the vehicle in which he was riding, about half a mile this side of the toll-gate on the Ocean House road, last Monday evening at about 7½ o'clock. Deceased was driving, accompanied by Mr. Weston, also a clerk in the Custom House, when they were precipitated down a bank about fifteen feet high, instantly causing his death by the breaking of his neck. Mr. Daniels was a native of Massachusetts, and leaves a wife and interesting little daughter in Northampton, with whom we sympathize, to mourn his loss. He has resided in this city about five years. He was a man of good business habits, and highly esteemed by those who knew him. His remains were followed to their resting-place from the house of Ira P. Rankin, Esq., of this city, by his friends and a large concourse of Master Masons, to which order he belonged and dearly loved, and we sincerely trust that he has gone to that place where all good Masons hope to at length arrive.

A NATION OF ALE DRINKERS.—Mr. Gladstone, the Chancellor of the Exchequer of England, in his late financial report, calculates that the regular weekly allowance of malt liquor to each adult male in that country is six hundred quarts—nearly two quarts a day. Two hundreds millions of dollars a year are expended for what Mr. Gladstone terms the "national drink;" and he adds with a sort of glowing satisfaction, that there are no signs of the taste for it dying out.

INGENIOUS WORKMANSHIP.—A child's dress is exhibited in the inclosure of the Florence Sewing Machine Company, at the Fair, which was made by a lady of this city on one of the Florence machines, entire. That is to say, no other needle but that employed by the machine, was used in making any of its stitches. It is a beautiful achievement of art and industry, which every lady should see.

ANOTHER WEEK OF THE FAIR.—We believe that it is now generally understood that the Fair will close on Saturday next.

THE BIG TREES OF CALAVERAS.

Among the curiosities at the Pavilion are several sections of the bark and wood of the big trees of Calaveras. The thickness of the bark in one of these sections is seventeen inches. In connection with the entry which contains these specimens are also exhibited some cones which have fallen from the tree, which are very small, not larger than a hen's egg; also, some of the seeds, a dried twig, and a small tree, some fifteen inches high, which has been produced from the seed.

It is now some twelve years since the attention of the scientific world was called to the existence of these mammoth productions of our California forests. This was the first cluster of large trees which was discovered. Since its discovery, the existence of several other groves of the same extraordinary growth have been made known to the world, which are said to rival in magnificence and grandeur even the Calaveras grove. We have at least four such groves, and it is thought that others may yet be discovered. It is said that a grove exists in Tuolumne county, at a locality very inconvenient of access, which is even finer than that of Calaveras; and it is quite a pleasant reflection to know that these wonders of the California mountains are not confined to any one spot, but that several grand companies of these forest giants exist, to neither of which the world has yet been able to furnish an equal.

According to Professor Brewer, of the Geological Survey, great numbers of these trees are found near the head of King's and Kern rivers, not in isolated groves, but scattered around promiscuously, at altitudes varying from 5,000 to 7,000 feet above the sea level. He found one tree, near Thomas' sawmill, forty feet in diameter—nearly twice that of the largest in the Calaveras grove, according to the measurement given below.

For several years after their discovery there was considerable difference of opinion among scientific men as to the true position which the tree occupies in the botanical system. Soon after its discovery, an English botanist, supposing it to be a new species, named it "*Wellingtonea Gigantea;*" which, however, a patriotic American proposed the more appropriate name, "*Washingtonea Gigantea.*" It was subsequently named "*Taxodium Gigantium,*" by Messrs. Kellogg & Behr, in a paper read before the California Academy of Natural Sciences, in May, 1855. In the succeeding August, Dr. Torrey, the distinguished American botanist, who recently paid a short visit to the Pacific coast, in a communication to *Silliman's American Journal of Science*, settled the matter to the satisfaction of the whole scientific world by placing it, where it undoubtedly belongs, in the same *genus* as the redwood—which was already known as the "*Sequoia*"—and this being a larger species than any previously known, was very properly called the "*Sequoia Gigantea.*"

The name having thus been definitely settled, it has fallen to the lot of our present scientific visitor, Dr. C. T. Jackson, of Boston, to furnish the first accurate and reliable measurements of the chief individuals of this gigantic collection of trees. The Doctor, it will be recollected, recently visited that vicinity in company with Joseph B. Meader, Esq., of Stockton. We now give, for the first time, to the public, the following extracts from his note-book, which were also read before the California Academy of Natural Sciences, in this city, on the 7th ultimo:

Measurements of the hight and circumference of the most noted of the "Big Trees" (Sequoia Gigantea), by Charles T. Jackson, M. D., and Mr. Joseph B. Meader, August 2d and 3d, 1865.

We were provided with a Sir H. Douglass reflecting semi-circle, a reflecting level, and a measuring tape, and by means of these instruments have made quite accurate measurements.

The horizontal point, or level, was first ascertained on each tree by means of the reflecting level, and the angle was measured to that point, and the difference of level was corrected for in each case. By means of the tape the base lines were determined, and the circumference of each tree at least six feet above the ground, or where the tree took its proper form, was measured. Sir H. Douglass' reflecting semi-circle is made so as to protract the angles, and it carries also a scale for measurement of the sides of the triangles protracted.

In several instances we repeated the measurements, with different bases, especially in those where too high an angle introduced the error of refraction of the glass of the mirrors.

Names of the Trees.	Hight in feet.	Circumf'e feet above the roots.
T. Starr King	363	50
General Scott	327	45
General Jackson	320	42
Two Sentinels (Front of hotel)	316	—
Salem Witch	310	—
Trinity	308	48
Mother of the Forest	305	63
Wm. C. Bryant	305	40
Henry W. Beecher	291	45
Granite State	286	50
General Washington	284	52
Abraham Lincoln	281	44
Bay State	280	48
Old Kentucky	277	45

Arbor Vitæ Queen	258	31
Beauty of the Forest	258	—
Henry Clay	241	44

Asa Gray (nobis), nearly as high as the John Torrey.

We measured the following large pines near the hotel:

P. Englemanni, or yellow pine	232	27
Another	220	19
P. Lambertiana, or sugar pine	165	—

The big stump covered by the Stump House has a mean diameter of 23 feet 1½ inches, and its least possible age is 1,380 years, allowing only 10 annual rings per inch. The extremes are 10 and 60, and computing the mean 35 per inch, the tree will be 4,830 years old.

ORIGIN OF THE BONNET.—The first bonnet worn in England was brought from Italy in the reign of Queen Elizabeth, and its form was a compromise between the present Italian hat and French hood. The materials employed in constructing these head ornaments were crimson satin, elaborately embroidered, cloth of gold, and similar rich materials. The Leghorn hat, with perpendicular crown and wide brim standing out far around the face, was the first legitimate bonnet worn, and this appeared long after Queen Elizabeth's time. It was trimmed with artificial flowers and immense bows of ribbons. Our present neat and exquisitively delicate and tasteful head-covering is but a modification of this huge affair, which not very many years back was so universally worn and admired.

SINGULAR PETRIFACTION.

We have received from the editor of the Colusa *Sun*, a very singular petrifaction, recently found by Mr. Reed, in Bear Creek, Colusa county. The specimen is about the size of a man's clenched fist, and of very much such shape. At the extreme front thereof are the distinct remains of what were thought to have been iron nails, about six or eight penny in size. The petrifaction was once evidently a hard, close-grained piece of wood, and the question naturally asked, was, "Who drove those nails in that wood?"

Petrifaction itself is really but little understood. It is one of the secret, quiet operations of nature, that in the present state of human knowledge, can only be faintly explained. Its process is curious beyond parallel, and is of a nature similar to the physiological phenomena of the assimilation or conversion of nutriment into the fluid or solid substance of the animal body. It is universally conceded that the process of wood petrifaction is very slow; requiring ages for its consummation; yet authenticated cases of the total or partial petrifaction of the human body in a very short space of time, are quite common. Several occur to us as we write—one that of an elderly woman buried in Philadelphia in 1857. The grave was opened in May last, when her body was found completely petrified, and as perfect in form and appearance as when placed there, with the exception of the nose which, alone, was slightly decayed. It required the united strength of eight men to raise the body from the grave. When the grave was dug, a spring of water strongly impregnated with lime was struck, and flowed so freely that it was found necessary to bail it out before lowering the coffin. Hence the phenomena. The time which had elapsed had not been sufficient to at all affect the coffin. The body, however, from its more perishable nature, had yielded—as it is generally conceded that the tissue, whether wood or flesh, must decay to give place for the petrescent particles.

We have no doubt but that the petrifaction from Colusa, for such it really is, is of quite as ancient an origin as the numerous instances, and great masses of petrified wood so often found in nearly every portion of our mines. What appears to be nails is nothing but a deposition of iron, in the form of elongated crystals of sulphurets of iron. A close examination would appear to settle that matter beyond a doubt. We often hear of petrifactions being formed in a few weeks, or even days, in some springs of a peculiar mineral character containing large quantities of lime in solution. These petrifactions, however, are merely incrustations. The stoney matter having been newly formed over and around the wood, inclosing the same, as it were, in a closed case; but not displacing the woody fibre, as is done in a true petrifaction. Fleshy matter, under certain favorable circumstances, as in the instance above cited, may be petrified in a very short period of time, from the fact of its early decay, allowing a rapid displacement of its particles, and its entire conversion into calcareous matter, the only character which such rapid petrifactions assume.

Descriptive Catalogue

—OF THE—

INDUSTRIAL EXHIBITION

Of the Mechanics' Institute, 1865.

CONTINUED.

459 Mr. Bugbie, Folsom: three boxes Raisins, California growth.

These raisins are of Califoraia growth, and appear to be of a very excellent character. Mr. Bugbie is now making a business of putting up raisins. He considers the climate aad soil of California as well fitted for the production of the raisin grape as for those varieties best calculated for wine. In his laudable effort to introduce this important branch of domestic production, Mr. Bughie cannot fail to have the warmest sympathy of every Califoraian, and it is to be hoped that his efforts in this direction will be a pecuniary as well as physical success.

460 Baker & Hamilton, Sacramento: one Gang Plow, with seed sower and harrow attached; two steel Plows.

This machiae is a combination by which the ground is plowed, the grain sowed and subsequeatly covered, all at one operation, or by once passing the machine over the ground. The plows are three in number, aad so arranged as to be lowered or raised, or kept in any given position, by a conveaient cogwheel arrangement, directly under the control of the driver. It is said that over 100 of these machiaes are now is use in this State.

461 M. Price, San Francisco: one case Cutlery, California make.

462 Wilson & Evans, San Francisco: one case Guns and Sporting Articles.

463 A. J. Plate, San Francisco: one case Guns and Sporting Articles.

464 Charles Slotterbeck, San Francisco: one case, two Rifles and one Shot Gun.

465 Vallagia, San Francisco: one case containing six double barrel Shot Guns, one Rifle, and one pair extra Barrels.

466 B. Largoardi, San Francisco: one case Shot Guns and Sporting Articles.

467 A. Harrisou, San Francisco: one model Patent Chimney Top.

469 J. L. Chaee, San Francisco: one Straw and Hay Cutter.

The knives of this cutter are fixed longitudinally nround the circumference of solid cylinders—there being two of them—which are rotated by a crank and cog motiou, drawing the straw towards them, and cutting as fast as it draws.

470 Jacob Runyon, Sac. River: twelve varieties Pears; five varieties Apples.

473 C. C. Cooledge, San Francisco: twelve Ball and Socket Trusses, and two Washington Shoulder Braces.

The peculiarities of this truss consist in a hall and socket joint for supporting the pad, aud a movable arm, by which a single truss may be used as either a right or a left one. By a combination of the movements of the ball and socket and movable arm, any desirable angle may be obtained. These peculiarities will be fouad very important, and are well worth the attention of those interested in or conversant with such things. It is the invention of Bartlett & Butman, of Boston, patented about a year ago. They are being very generally introduced in the Eastern States. The shoulder braces are employed for strengthening and straightening the shoulders and keeping them in a proper position, at the same time answering the purpose of suspenders.

481 Samuel Brannan, San Francisco: five bottles Calistoga Wine.

482 Bath & Morrison, 118 Bush street, San Francisco: Butcher's Cart.

This is a neat and substantial piece of workmanship, executed by the exhibitor, in this city.

483 J. & C. Schrieber, San Francisco: Spring Mattrass; four Feather Pillows; two Pulu Pillows; one bale Pulu; one Bedstead.

These gentlemen have on exhibition a spiral spring bed, for which a patent was issned on the 25th of October, 1864. The peculiarity of the patent consists in the mode of tying the springs, the springs being tied near the centre downwards, making the bed firm and substantial, as well as elastic; from the centre up to the top of the spring, separately, ruas a cord which forms a brace to each spring, giving a softness which no other mode of adjusting can give. It is admitted by manufacturers and dealers, and others who have this new patent in use, to be superior to any spring-bed heretofore offered to the public. This exhibition is well worthy of examination by all those in want of a comfortable bed or other similar articles of furniture. The spring mattress mentioned above is a California invention, known as O. Fuller's improved method of bracing spiral springs. The exhibitor holds the right for this State.

485 Henry S. Smith, San Francisco: Dunbar's Steam Piston Packing.

This is a self-adjusting packing, so constructed as to require no springs or screws; is always steam-tight, acts with but little friction, and never becomes loose or leaky. It can be applied to any engine, old or new. This packing is now being extensively introduced on this coast. It is said that for cylinders which have become loose from wear, this packing is the best practical remedy.

486 Greenberg & Co., San Francisco: one bale white cotton Batting; one package white Cotton Waddling.

491 Brown & Batters, Oakland: nine Shoe Lasts, manufactured at the Pacific Last Factory.

These lasts were made at the Pacific Last Factory, at Oakland.

492 George W. Edwards, San Francisco: one Army Printing Press.

This is a small press, with a bed about six by eight inches in size, said to have been of the same pattern as those used by all our army corps commanders in their various campaigns during the late war of rebellion. The press is extremely simple and compact, requiring but very little weight of metal, and not at all liable to get out of order. The bed is made to move by a crank and cog-motion, forward and back, under a stationary cylinder, which revolves by its friction upon the frisket covering, giving an impression each time; the bed with the form passes under the cylinder, whether backward or forward. The tympan rises and falls automically, so that the pressman can turn the crank back and forth with one hand, and ink aud lay on and take off the sheets with the other.

493 Cameron, Whittier & Co., San Francisco: three boxes Glue; one bottle Neat's Foot Oil.

495 Union Carriage Factory, San Francisco: one Milk Wagon.

This wagon was built in San Francisco, by Messrs. Stein, Link & Schert, for the San Francisco Dairy. The body is beautifully finished, and the entire vehicle is a substantial piece of workmaaship.

496 J. E. Jorgensen, 28 Third street: one Air Tight Stove.

This stove, which is quite ornamental in its construction, was made at the manufactory of the exhibitor, No. 28 Third street, San Francisco.

497 Boyd, McAuliff & Co., 412 Pine street: two Parlor Doors, rosewood imitation and California laurel.

There are two parlor doors included in this entry. The one upon the left is made of common redwood, stained and grained to imitato rosewood. That upon the right is made of California laurel. The two panels are simply polished, without being stained or grained, showiag the natural grain and beauty of the wood. The frame work of the door is grained to imitate black walnut and mahogany. The mouldings are in imitation of rosewood. The beauty of the natural laurel cannot he excelled by any wood which grows. The imitatioas are almost faultless; the smoothness and polish of the whole is admirable, and reflects the highest credit upoa the artists.

500 Ben. E. Harris, 314 Jessie street, San Francisco: self-regulating Feed Box.

The self-regulating aad provender-saving feed box, for horses, it is claimed, produces a thorough mastication and digestion, resultiag in a saving of twenty-five per cent. in quantity of provender, with an increase in benefit of ten per cent. ia the condition of the system of the animal, when fed from this box.

501 Peter Lunay, San Francisco: one Steam Governor; one model Oscillating Engine.

503 W. H. Scoville & Co., San Francisco: four boxes Candles; one cake Acid Block.

One of the most important branches of domestic manufacture on the Pacific coast is the production of candles. Nearly one million of dollars are annually sent to the East for this indispensable article of consumption, which in most countries is confined to domestic use, but which here enters so largely into consumption for underground work in the mines. Nothing but the most indifferent article has hitherto been produced here, although several unsuccessful efforts have been made to produce a merchantable article of adamantine candles. It is believed, however, that Messrs. Scovillo & Co. have, at length succeeded in producing an article which fully comes up to the demand, and which can be manufactured at a price to compete successfully with the imported article. Adamantine candles are manufactured from tallow, first chemically prepared, and subsequently subjected to a powerful hydraulic pressure. In this condition the preparation is known as an "acid block," one of which is exhibited. These blocks are melted down and run into candles, to which the name adamantine is given from the peculiar hardness and ring, so different from the character and sound of ordinary tallow. The article now exhibited is pronounced, by judges, to be fully equal to the average, if not the best, of the imported article, and the enterprise should be met with the liberal encouragement which its importance demands. Dealers will do well to exame the samples on exhibition.

505 C. C. Keene, San Francisco: one case Musical Instruments.

508 H. J. Booth & Co., one Steam Engine, driving machinery at Mechanics' Fair.

Here we have the grandest and most magnificent piece of mechanism in the Exhibition—a 40-horse power engine with one cylinder, fourteen inches in diameter and 30-inch stroke, with Irving M. Scott and W. R. Eckart's self-adjusting cut-off regulator. The valves of the engine are worked from a drag crank shaft, instead of eccentrics, thereby allowing ease of access to all parts; simplicity of design; has less joints and less friction than eccentrics. The point of cut-off is variable from full to no steam, and is regulated according to the work the engine has to do, from the governor, thereby producing a great saving of fuel over other engines. In the construction of these engines *lightness* has been the thing aimed at, and strength has only been sought in the *design*, *construction* and *good* quality of the *material* used. The first engine of this kind was designed and constructed for driving the machinery of the Union Iron Works, which duty it has been performing with unlimited success for over a year, both as to expense of *repairs* and saving of *fuel*. This engine runs remarkably smooth, and attracts alike the admiration of the skilled engineer and the unpretending lover of science and art, by its powerful but silent and majestic movement.

511 Cameron, Kuenzle & Mills, San Francisco: one Album Stereoscope.

This is a new optical instrument, and is known as the "Mills' Album Stereoscope." It is a California invention, and one of much importance in connection with the elegant and useful art of photography. It is designed to accompany and render far more interesting and useful those elegant household treasures kaown as "Ladies' Photographic Albums." It consists of a plano-convex lens, a concave silver speculum, and a chromium; all arranged in a small box, turned out of solid rosewood or ivory, aad so combined as to neutralize the shadows cast by the rough surface of the card and give a flesh-like softness, tone and life appearance to the magnified picture, in place of the harsh, cadaverous and unnatural effect produced by the common magnifying lens or stereoscope. It is applicable equally to card pictures, ambrotypes and the new style of photographic miniatures on porcelain and ivory. In a *good picture*, the apparent transformation from a mere picture to the living person, with his full, clear, natural expressiou, is wonderful, and the effect is in exact proportion to the excellence of the original picture. It thus enables the owner to guard against accepting inferior likenesses from any class of operators.

513 N. S. Arnold, San Francisco: one Monitor Washing Machine.

This machine received a diploma at the last Fair of the Institute, as the best washing machiue on exhibition.

516 J. C. Trask: one Hay Press.

521 M. Keller, Los Angeles: four bales Tobacco; three Cotton Plants.

This tobacco was raised upon the ranch of Mr Keller, near Los Angeles, where he has a large crop growing. The cotton plants are from the same ranch. Mr. K. has 110 acres of cotton now growing, from which he expects to realize about 150 bales of 300 pounds each. The Legislature has offered a premium of $3,000 for the first 100 bales of cotton of 300 pounds each, which may be produced in this State. Several parties are competing for this premium, and among them is Mr. Keller.

524 Vulcan Foundry San Francisco: one Baux & Guiod's Separator and Amalgamator, California invention, manufactured at Vulcan Iron Works.

The chief merits of this pan consist in such an arrangemeut of the mullers as to cause the pulp to spread from the center to the outer rim of the pan, and with such velocity that the particles of metal are thereby injected into the column of mercury, distributed around the circumference of the pan, and which the motion of the mullers causes to rise several inches without coming in contact with the grinding surface of either muller or pan. By this arrangement the objection of grinding of the ore in coatact with the mercury is avoided. The discharge of the pan is from an aperture in the center and top of the lid, (for the pan is closely covered) while the motion of the grinders is at the bottom of the pan. This arrangement is designed to prevent such heavy substances as gold, silver, or mercury from floating off with the water.

525 Charles Biddleman, San Francisco: one tray and one box of Precious Stones.

526 Robert Caster: three Tea Economizers.

527 Gavin Cibb & Co., San Francisco: three barrels Paint; three half barrels Paint.

530 Caleb M. Sickler, Kearny street: Coal Hods, California make.

531 Theodore Severin, 522 Kearny street: two show-cases Pistols, Guns, etc.

The home-made rifle in this exhibition has not been sent to the Fair for elegance; but for solidity and correctness of workmanship. It was intended and manufactured not for show but for use; and in that view will be found superior in quality, as can at any time be proven by trial.

534 E. C. Mitchell, San Francisco: one combined Faucet and Measure.

535 J. E. Jorgensen, San Francisco: two Hendrickson's Chimney Tops.

541 Rix, Logan & Co., San Francisco: one Hammer Battery.

This is a new application of the principle of the well-known trip-hammer quartz mill, invented and exhibited by these gentlemen at the last Exhibition. That machine, it will be recollected, was designed for dry-crushing, and the hammers were made to strike down blows, as nearly as possible in imitation of a hammer blow given by the human hand and arm. That principle would be quite inapplicable to working in water; consequently an entire chaage in the mode of its application has been devised in the present machine. Space, at this time, will merely admit of our saying that it is founded upon correct scientific principles, which, so far as experimental trials show, are quite practicable in their application, and exceedingly effective in operation. The machine, although extremely simple when fully understood, is nevertheless very difficult of description without the aid of diagrams. With the exception of its octagonal shape, which is indispensable to the principle, it has every appearance of an ordinary pan; yet it is simply a "crusher," requiring a "cracker" similar to Blake's or Hanscom's, to precede it, and a triturating and amalgamating pan to follow it. There is perhaps no machine in the Pavilion which involves more scientific detail than this. The principles of its construction and the philosophy of its operation combine and unite all the advantages of both dry and wet crushing, with apparently none of the objections of either—the importance of which need only be mentioned to be fully appreciated by all quartz mill men. If it should succeed in actual practice, as well as it appears to do experimentally, there is much reason to believe that the inventor has hit upon a valuable as well as novel method of reducing quartz.

543 Gallagher, Weed & White, San Francisco: one Steamboat Gong Bell.

This gong-bell is from the Brass Foundry of Messrs. Gallagher & Weed, and is of fine workmanship and superior tone—equal to the best imported.

545 J. Strahle, San Francisco: one French Carom Billiard Table; one Centre Table.

The small French carom table which is included in the above entry, was manufactured in this city, by the exhibitor, who is the pioneer billiard table manufacturer on this coast. The one now exhibited is No. 1,879 of his make. The bed is of Vermont slate, which is considered by many superior to marble for such work, by reason of its greater strength. The cabinet work of this table is very superior. Mr. S. obtained the premium for cabinet work last year. A small drawer has been neatly placed in one end, for receiving the balls, chalk, etc., when not in use. Mr. S. makes numbers of tables for private houses in this city and vicinity. The top of the elegant centre-table, standing near, is of the same kind of slate as that used in his billiard tables, which is brought from the town of Hitewell, Vermont. It was polished and colored in imitation of marble, by Messrs. Hitewell & Co., of whom Mr. S. obtains his slate beds, ornamented in the centre with the likeness of Mr. Strahl, copied by traasfer from his diploma, and sent out as a present by his Green Mountain friends. The neat and highly finished base upon which it rests was made by Mr. S., at his manufactory, ia this city.

547 A. M. Stetson, San Francisco: one Self-Operating Amalgamator.

We have already described the principle upon which this amalgaaiator works in noticing the model, under aaother entry. This machiue is of working size, and visitors will have an opportunity of seeing it at work during the exhibition. It is self-operating, aad has proven very efficient as a gold-saver when placed after all other appliances.

549 J. & W. C. Salmon, S. F.: one Model of Settler.

This little machine is run every evening at the Pavilion, by gas generated in Frink's soda apparatus.

550 J. F. Dow, Russian River: sample of Corn.

These stalks of corn are thirteen feet high.

552 Goodwin & Co., San Francisco: one Parlor Set, in green and gold finish.

We have here a full parlor set of rosewood aad green and gold brocatelle, which shows off to great advantage, especially by gas-light. The ladies are particularly attracted to these elegant pieces of furniture. They also exhibit a red plush parlor set, a library set, a bedroom set, an elegant sideboard, and a splendid Turkish chair, made at their manufactory, in this city. This firm received the premium last year for the best exhibition of upholstery.

554 A. N. Rood & Co., San Francisco: one Job Press.

In this entry we have a new small size Degener Liberty Press, which works neat and rapid, throwing off cards to visitors. The proprietors are advertising agents, and circulate the cards free, in accordance with their contract with certain advertisers. Like their neighbors of the DAILY FAIR PRESS, they seem to be doing an active business.

555 Carlton Newman, San Francisco: one lot Fruit Jars.

556 Wm. H. Jessup, San Francisco: two lots Matches, in glass cases; one lot Matches, in boxes—California manufacture.

557 O. Irwin, Marin county: one specimen of White Red wood.

559 Charles A. James, San Francisco: samples of Eureka Patent Blasting Powder—California manufacture.

This powder is manufactured on the San Bruno road, in this city, and is now being quite extensively introduced into the mines for blasting purposes. Those who have used it generally pronounce it fully equal to the best of ordinary blasting powder, bulk for bulk; while a decided advantage is gained in transportation, by the decrease of weight. It is not permanently injured by wetting, but may be dried and rendered as effectual as ever. It also possesses the peculiar advantage of producing much less smoke than ordinary powder.

560 W. Bloom, San Francisco: one bundle Tanned Sheep Skin.

563 Z. Sykes, San Jose: one Seed Drill.

This machine is an Eastern patent, bnt is manufactured at the Golden State Foundry, in this city. The drills are made, the seed dropped and covered—all at one and the same time—as the machine moves over the ground.

568 Lewis Leland, Occidental Hotel, San Francisco: one case Specimens, and pieces of the Big Tree of Calaveras county.

574 M. McLaughlin, Foreman Broderick Engine Co., San Francisco: Gold Medal.

This beautiful work of art has been furnished by the members of Broderick Engine Co., of this city, to be presented by them to John Decker, Chief Engineer of the New York Fire Department. It is a truly elegant and appropriately designed testimonial, and exceeds in value $500. The design is a shield, surrounded with elegant scroll work, and surmounted with a spread eagle, ladder and fire-hook. The centre of the shield shows the coat of arms of California in *basso relievo*, with the word "Eureka," and thirteen stars. The whole is six inches in length by three wide, and every portion is finished in the highest style of art, by Messrs. Pohlmann & Bellemere, 516 Clay street, San Francisco. This splendid badge will doubtless be much admired and highly prized in the Atlantic metropolis. The whole is a neat affair on the part of the Broderick boys.

578 E. F. Mock, Petaluma: Model of Hay Press.

This is a new California invention, and is exhibited in model only. It works upon a principle entirely new. The hay is fed into the machine by a trough, and in the same manner that straw or other material is fed to the knife of a straw cutting machine. Instead of encountering a knife, however, it first meets and passes between rollers, which crush the hay, cotton, or whatever it may be desired to press, passing it through in the shape of thin sheets, and taking from it nearly all its elasticity; beneath the rollers is a vibrating carriage, which moves back and forth through a space equal to the width of the bale which it is intended to produce, and into which the stream of pressed material is made to pass. The backward and forward motion of this carriage or box causes the material to fall in folds. This is all accomplished by simply turning a crank. When the box is thus filled, by a slight change in the adjustment of the machinery, a still further turn of the crank forces down a follower, which presses the folded hay firmly into the box. Another slight adjustment carries the box with its load of pressed hay forward a few inches and automically deposits it, by the use of the same crank motion, in another box, open upon the two sides, the closed box being immediately withdrawn, to receive a new packing from the rollers. While that is being done, the tyers secure the first

bale and remove it preparatory to receiving the second. The whole operation is very simple, rapid and easy of execution; requiring apparently but little power. The invention is quite novel, and well worthy the attention of farmers and others interested in packing and pressing heavy goods. It was invented by Mr. W. B. Mock of Petaluma, who died a few weeks since, just after he had completed his machine. It is now in the possession of his brother, E. F. Mock, the exhibitor.

570 W. B. Lake, Agent, No. 20 Government House, San Francisco: Lincoln's Latest Chamber Drill—Godfrey & Shurwood, proprietors.

This drill is designed to form a chamber at the bottom of an ordinary drill hole, by the forcing outward of diamond cutters at the base of the drill on the descent of the blow. It is simple in construction, and works with apparent success. The enlargement of the hole at the bottom admits an increased charge of powder and gives the explosion an upward purchase, rendering the blast much more effectual in hard rock.

580 Wm. A. Wolfe: one bundle of "equisetum hyemale," commonly known as Horsetail or Dutch Rush.

These plants, which were produced upon the grounds of Dr. B. J. Smith, at the Health Institute, four miles from Oakland, are of extraordinary growth, measuring six feet six inches high. These plants are leafless, with hollow stems, and contain an extraordinary amount of silicious matter, to which is due their extremely firm texture or organization. They are used for scouring purposes, and for polishing wood and metals. They are extensively employed in some parts of Europe for putting the finishing touches upon manufactured articles of ivory.

581 Andrew Hunter, San Francisco: Sulphurets concentrated by Hunter's Concentrator.

582 Grover & Baker Sewing Machine Co., J. W. J. Pierson Agent, San Francisco: seventeen Sewing Machines; also, lot of Clothing and Articles made upon said machines. Entered for premium.

The following samples of work from this machine are on exhibition, and are well worthy of a careful examination: Blue silk opera cloak, embroidered, appliqued with white velvet, lined with white silk, quilted in flowers and diamonds; cloth smoking jacket, faced and lined with pink silk, quilted in diamonds and flowers; white muslin dress, made up of alternate rows of fine tucking and puffs—trimmed with insertion and edging; white lawn dress, with very fine tucks; white marseilles dress, braided with black; green poplin dress, appliqued with black velvet. This work was executed on the Grover & Baker Machine, by Mrs. I. Harding, formerly Mrs. P. E. Rogers.

It is claimed for this machine, that—

1. It is more simple, durable and less liable to derangement than others.

2. It sews from ordinary spools, and no re-winding of thread is necessary.

3. It sews with equal facility all fabrics, the most delicate and the heaviest, and with all kinds of thread, silk, cotton or linen.

4. Its seam is so strong and elastic that it never breaks, even on a bias.

5. It fastens *both* ends of the seam by its own *operation*.

6. Its seam, though cut at every sixth stitch, remains firm, and neither *runs* or *ravels* in wear.

7. Its seam is more plump and beautiful, and retains its plumpness and beauty, after washing, better than any other.

8. Its seam can be removed in altering garments, AFTER PROPER INSTRUCTION, without picking or cutting them.

9. Watching and varying the tensions upon the threads, necessary in other machines, is unnecessary in this. The tension being once adjusted on the Grover & Baker machine, any amount of sewing may be done without change.

10. It makes beautiful embroidery without any change of arrangement, simply by inserting threads of suitable sizes and colors for this purpose. It is the *only* machine that *both* embroiders and sews perfectly.

583 Goodwin & Co., San Francisco: Chamber Set, consisting of four pieces.

584 P. B. Comins, San Francisco: two bottles of Sauce.

585 Mizgill & Cooper, 810 Market street, San Francisco: one Shoeing Hammer.

586 Blake & Co., San Francisco: machine for Manufacturing Gas.

This is an automatic gas machine, designed for use in public buildings and private families. The machinery works by means of a weight, which has to be wound up, and commences making gas when the lamps are lighted, ceasing the operation when they are extinguished. The gas is manufactured from gasoline. By the use of this machine it is claimed that a single burner will consume only one gallon of gasoline in forty or forty-five hours. Gasoline is worth about fifty cents a gallon. From this one may easily calculate the approximate cost of lighting a building. The machine can be placed in the basement or any other convenient place about the house, requiring only about as much room as an ordinary bureau.

588 Phillip Hinkle, San Francisco: one Grinder and Amalgamator.

This is a grinder and amalgamator combined. The principle of its construction is quite novel, simple and apparently effective. The pan on exhibition is of model size, yet sufficiently large to do very effective work. Instead of the ordinary mullers, covering with their grinding surface the entire bottom of the pan, there is a set of small mullers revolving around the shaft and reaching about one-third the distance to the circumference. At the extremity of the arms is a hinged muller, hung on arms connected with a single bolt, and so arranged that when the arms revolve the faces of these mullers are pressed outward, by centrifugal action, against the inside surface of the rim of the pan; thus, instead of acting upon the bottom of the pan, as the ordinary mullers do, it forms a grinding surface with the side, and is so hung as to admit of the pulp being readily forced between the grinding surfaces thus formed. The centrifugal action of the whirl of the pulp in the pan naturally carries the coarser particles toward the circumference, just where they are wanted to be properly reduced. A copper cover, formed with an inverted cone shape, with an opening in the centre, and reaching nearly to the circumference of the pan, is so placed that the pulp is made to overflow at its outer rim, and run down upon its inclined surface, discharging at the centre. By this means a constant current is kept up from the centre to the circumference, and the cover being made of copper and coated with mercury, adds greatly to the amalgamation. The quicksilver is placed in a slight depression in the bottom of the pan, entirely removed from the action of the mullers. The rock only requires to be crushed to the size of peas for this pan, the pan generating its own heat by friction, requiring no steam for that purpose. This pan was manufactured at the Novelty Iron Works, in this city, and is the invention of the exhibitor, Phillip Hinckle.

609 Pacific Guano Company, San Francisco: one sample of Guano, from Johnston's Island.

604 G. W. Traver, San Francisco: four Minor's Patent Pocket Lanterns.

By an ingenious device of hinges, etc., this lantern, when not needed for immediate use, may be folded up so as to occupy no more space than a somewhat thick memorandum book. Isinglass is employed instead of common glass. Mr. Minor is the inventor.

— B. L. Perkins, Golden Gate Seed Gardens, Oakland: 22 varieties of Pears; 23 do. of Apples; 7 do. of Plums; 7 do. of Dried Fruits; 1 jar of Brandy Peaches; 108 varieties of Seeds, in bottles; 70 varieties of Garden Vegetables.

COLLECTION OF MINERALS, ETC.

—INCLUDING—

Minerals, Mineral Oil, Fossils, Curiosities, Models, Etc.

Contributed to the Exhibition of the Mechanics' Institute of 1865, through the care of Dewey & Co., proprietors of the MINING AND SCIENTIFIC PRESS.

21 E. Benoist, 643 Third street, San Francisco: three bottles Crude Oil; three do. Lubricating Oil; three do. Burning Oil; three do. Benzole Oil; one plan of Still, United States patent. Plan of Still invented by A. Millack, New York.

This is one of the most important and significant among the minor exhibitions in the pavilion. It consists of samples of crude oil from various sections of the State, exhibited by the side of the burning fluid, lubricating oil and benzole manufactured from those crude oils. This exhibition testifies most unmistakably to the fact that California can not only provide the raw material; but also the skill to transform that raw material into the several parts and conditions requisite for applying the same to the various commercial purposes for which each is suited. Mr. Benoist, the exhibitor, is prepared, whenever suitable encouragement is given, to undertake the refining of oil to any extent which the commercial wants of this city may require. He has fully proven, by practical experiment, that the oil of the California wells and springs is fully equal, and indeed generally superior to that obtained from the oil regions of the Atlantic States. A most favorable opportunity appears to be afforded at this time, and during the present high price of oil, to embark in the enterprise of refining. Where, as in all human probability will soon be the case in this city, oil will be brought directly to the refinery for manufacture, a very small capital only, will be required to initiate and carry on the business. Parties interested will do well to consult with Mr. Benoist upon this matter, who is probably better acquainted with the business than any other person on this coast.

62 Charles F. Boshew, San Francisco: twenty papers Warren's Lustrina; one specimen of Gold and Quartz from Isabella Mine; one specimen of Gold Quartz from Nimrod mine; one specimen Gold Quartz from Gold Point Mine; one Shell with Lord's Prayer written upon it.

The material from which this lustrina is manufactured appears to consist of finely pulverized silex in a soft cement of either a magnesian or calcareous character. The manufactured article is said to be a very valuable article for polishing tin and brass ware, cleaning glass, etc.

113 B. H. Ramsdell, San Francisco: one piece Coal from Black Diamond Coal Mine. [Described in 113 of the General Catalogue.]

116 California Borax Co., San Francisco: one case Borax. [Transferred to Art Gallery.]

121. Capt. J. M. Aiken, Coulterville, Mariposa county, Cal.: one case of California and Nevada Minerals, etc., containing upwards of four hundred specimens; one splendid Manzanita Cane.

The contents of this unique cabinet comprises 400 phials, containing 130 different kinds of minerals, including quartz and placer gold, argentiferous and auriferous sulphurets, coal, cinnabar, nickel, lead, copper, precious stones, petrifications, sands, several natural curiosities, etc. Capt. Aiken has devoted a large portion of his time for the last six or seven years in getting together this interesting and unique collection. Mr. Aiken has also, during the same time, collected a fine shelf cabinet of minerals, which, however, was too bulky to bring to this city for exhibition. The case itself is also a rare specimen and an elegant exemplar of the natural beauties of our California woods. It is made of seven different kinds of native wood, viz:—Manzanita, mountain mahogany, Indian arrow, granite wood (so called), live oak, red oak and sugar pine—each showing the natural grain of the wood, without paint or varnish; the surface being merely polished by a smooth instrument. This rare specimen of cabinet work is from the hands of Adolph Sinning, of Coulterville, who has thereby shown himself a most expert and tasteful artificer in wood.

This cane is manufactured from Manzanita and inlaid with Indian arrow wood. The head, eyes and ferrule, are of California gold; the former being set with an elegant specimen of gold-bearing quartz. The cane is made of manzanita, divided into six panels, bordered with Indian arrow wood. The first panel is inlaid with granite wood around the silver plate; the second and third, with mountain mahogany from Esmeralda. The silver is from Esmeralda. The whole is the workmanship of Adolph Sinning, and was executed on the North Fork of the Merced. The cane and case are valued at $150, at which price it will be sold after the Fair.

124 Arizona Consolidated Mining Company: one bar of Lead and Silver; one Specimen Silver and Lead Ore.

This magnificent specimen of argentiferous silver ore is from the Arizona Consolidated Mining Company's mine, on the Carmel lode, Eureka district, Arizona Territory. The assay value of 18 tons has been ascertained to be $130. An eleven pound bar of metal, accompanying this specimen, which was taken from twenty pounds of the ore, assays at the rate of $83 dollars in silver to the ton, and 60 per cent. of lead.

136 Lewis Leland & Co., Occidental Hotel, San Francisco: two cases Confectionery; one case Minerals.

This is an elegant assortment of specimens and curiosities, comprising a great variety of gold, silver, copper, cinnibar, and iron ores, etc. We have here a beautiful massive specimen of gold, in a dark colored quartz, from the Boise river. This specimen presents one of those rare forms of auriferous crystalization known as filiform; a rich specimen of gold ore from the famous Moss mine, near the Colorado, and other gold specimens from the Owyhee and several other important localities on the Pacific coast. There is also a very large and beautiful specimen of malachite (green carbonate of copper), from Australia; copper glance, (the richest of copper ores;) also a very fine specimen of azuline, (blue carbonate of copper.) Here may also be found two most elegant specimens of opalized wood (petrifactions) one of which is beautifully cut. We also notice a very finely polished specimen, labeled marble, but which, on examination through the glass without handling, we should judge to be steatite. The specimen is probably magnesian, and not calcareous. There is an elegant cabinet of lava and sulphur, collected at the sulphur banks and caves about the great volcano on the Sandwich Islands; also a piece of the coping of the famous Chinese porcelain tower which we read of as among the great curiosities of China. Mr. Leland also exhibits specimens of the bark and wood of the Big Tree of Calaveras county.

139 E. Rondal, San Francisco: six Specimens Copper Ore from La Victoire mine, Mariposa county.

This is considered one of the richest copper mines in the State. The largest specimen in the series exhibited represents the foot wall of the vein carrying yellow sulphurets, the second is a talcose ore of a peculiar character carrying a large amount of native copper; the other samples are made up of sulphurets and grey ore. A small seam of gold bearing quartz runs through the vein some specimens of which accompany the collection on exhibition.

213 V. M. Foucault, Washington Territory: one case Geological specimens.

This is a splendid display of some two or three hundred specimens of fossils, collected mostly in Washington Territory, and principally from the immediate vicinity of the Fuca Strait coal mine. It comprises shells, marine animals and plants, fossilized wood, bones, etc. These fossils are all from the tertiary formation, which immediately overlies the coal, and are mostly of species wholly unknown in any other portion of the world. The specimens exhibited, which are all of extinct varieties, comprise but a small portion of the entire number that has been collected by Mr. Foucault. That gentleman has devoted much time and expense in making these collections, and traveled many hundreds, if not thousands of miles, in search of them. Such collections, although they may seem to the casual observer of but little use, save as curiosities, are nevertheless of great practical value to the scientific man, in enabling him to determine the age of the various rocks, their relative position, and the probabilities of finding coal in their neighborhood. It is the intention of Mr. F. to devote all his leisure time for the next two years in making additions to his collection, after which time he will take it to Paris, where it will be submitted to the inspection of European *savans*, who, from the simple examination of these fossils, will be able to form almost as complete and correct an estimate of our geology, as they could from personal examination of the same.

214 H. M. McCormick, Tulare county: one lot Silver Ore, from Kearsarge district.

This ore is the only sample of ore on exhibition from this new and celebrated mining district. These samples are said to be characteristic of the general appearance and character of the ores of this district.

223 Mr. Layne, Placer County: specimens Silver Ore.

The peculiar interest attached to this rare exhibit is the rarity of silver ore on the west side of the Sierra. The mine is situated in Placer county, about four miles from Folsom, and is easy of access, having on this account a great advantage over the more distant and famous mines of Nevada. Mr. Layne exhibits a small brick of gold and silver bullion from this mine. It is claimed that one lot of 1,900 pounds of second-class ore from this mine, worked at the Pacific Metallurgical Works, in this city, gave $36 in silver and $16 in gold, while a lot of third-class ores, worked at the same establishment, gives as a result $20 per ton in silver and $10 in gold. One hundred pounds of first-class ore, worked at the San Francisco Foundry, yielded at the rate of $95 per ton in gold and silver, the latter predominating.

249 J. C. Gouldin, San Francisco: four specimens Argentiferous Galena.

253 L. P. Collins, San Francisco: seven specimens Copper Ore, from Taylorsville, Plumas Co.

These specimens indicate the presence of very rich deposits of copper ore, of the peacock variety. It is well known that, so far as the copper mines of this county have been opened, they equal, if not excel in richness, any mines of copper ore in the world. The cost of transportation as yet will not admit of their being very economically worked. Railroads, however, will soon bring the product of these mines into the market, when Plumas will ustonish the world with produce of copper

262 O. W. Euston, San Francisco: lot of Mineral Specimens.

An examination of this collection will give the visitor a very correct idea of several varieties of rock most frequently met with in the mining regions. We have a hornblende slate, from Amador; a talcose slate, carrying crystalized quartz, and a chloritic slate, from Campo Seco, Amador, and a clay slate from San Pablo. Of traps, we have greenstone trap from the hanging wall of the Union copper mine, and talcose amorphous trap from the Newton mine. A fine specimen of acicular hornblende from San Pablo. Two specimens of marble from the El Dorado quarry, and two from the El Dorado cave. A specimen of iron ore from a mountain mass of the same mineral near the Dana mine, Washoe, and a number of other interesting minerals, all of which, with these mentioned, are carefully labelled for identification.

291 Gus. Reis, San Francisco: samples of Silver Ore from Mexico.

These fine specimens of silver ore were taken from a mine located about 125 miles north of Mazatlan. It has been worked by Mexicans about thirty years, and is thoroughly opened. Some two years since it passed into the hands of its present proprietors; since which time a small mill has been built and the mine still further developed under the charge of Mr. W. C. Campbell. During the progress of this work, a small streak, which contained the chief pay rock, has widened out from a few inches to four feet in width, while the entire width of workable ore is as yet undetermined. The specimens exhibited were taken from this pay streak, about 1,000 pounds of which were brought up by Mr. Campbell, who recently arrived in this city. It will be observed that one of the large specimens exhibited contains a large quantity of native silver, while the others consist of an argentiferous galena. These two classes of ore appear to run side by side into the mountain, with every prospect of indefinite continuance. The company will send down heavy machinery in October next, and commence active operations at the mine. The working of the Mexicans has heretofore been confined exclusively to the argentiferous galena, of which almost the entire mountain seems to be pretty much composed. This ore has been worked in rude furnaces of their own construction, and pays from $50 to $150. The specimen on exhibition pays about $100 to the ton.

301 J. A. Bauer, San Francisco: one case Preparations—gold, silver and copper.

These preparations consist of a fine display of nitrate of silver, sulphate of copper and chloride of gold and sodium, all prepared by Mr. Bauer. The nitrate of silver is made by dissolving metalic silver in nitric acid. This preparation is used extensively in photography—about a ton of silver being thus required each year in the United States. We understand that Mr. B. obtains his sulphate of copper by a new process for which a patent has been solicited.

302 A. Hunter, San Francisco: one case Sulphurets.

These specimens consist of auriferous argentiferous and cupriferous sulphurets, also cinnabar, beach sands, etc. They have been concentrated by the use of Hunter's celebrated concentrator, the working of which has already been described under its appropriate head.

12 shs Overman at 325 per share,
12 shs Ophir at 310 per foot.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, September 2d, 1865.

The amount of capital offering for loan purposes shows no abatement, amply supplying the wants of all classes who can furnish the requisite security. A fair demand prevails in bank circles, and choice names are passing at 1@1¼ ₱ cent. per month, the latter being the current rate for the usual discounts made. In the open market, negotiations are effected at 1@2 ₱ cent. per month according to the character of the collateral offering.

Receipts of treasnre from the interior and uorth coast since Saturday last amounted to $800,000, making an aggregate of $4,800,000 for the month of August. The yield of Nevada for the months of July and August has been less than $2,000,000, as against $2,800,000 during the two previous months.

Bullion has been in rather light supply this week, and a good demand prevailed for to-day's steamer. Gold bars were sold yesterday at 845@850, and silver was quotable at about par for average lots.

The Mining Share Market has been somewhat apathetic since Monday last, and transactions at the Board were of less importance than for a month past. There is little or no improvement to note, and some stocks are lower than at the close of last week. Nevada advices have been devoid of special interest, but so far as we can learn, the work of development is progressing with the usual vigor, without disclosing anything new.

Gould & Curry declined to $1,100, and is now offered at $1,200. The receipts of Bullion for the month of August amounted to some $175,000—equal to those of the previous month—and the ore redneed has averaged about $45 per ton. There will probably be no dividend for the month of August, for the reason that large disbursements have been made during the past sixty days, and still are required to pay for supplies needed at the mine and mill the coming fall and winter. For wood and timber alone, an aggregate expenditure of at least $100,000 will be necessary, and other extraordinary outlays will perhaps exceed that amount. It is proper to state, however, that a large portion of this indebtedness has already been provided for out of the net earnings of the mine. The company have on their dump pile and at their mill more thau 3,000 tons of ore, and are hoistiug an average of 100 tons per day.

Alpha has met with uo sale during the week, but is well controlled, and firmly held at about $1,900 per foot. Recent developments are regarded with much favor, and the affairs of the company are thought to be in a promising condition.

Yellow Jacket has continued to be actively dealt in, and 150 feet were sold, opening at $1,505, dropping to $1,480, advancing to $1,545, receding to $1,440, rallying to $1,450, and selling yesterday at $1,440 @1,435. For the two weeks ending August 21st, 1,601 tons of ore were extracted from the mine, and 1,548 tons were reduced, producing an aggregate of $58,267, and averaging $37.50 per ton. The Morgan Mill is to be completed and in running order on the 10th iust. Since April 15th, when the mill came into the possession of the company, 2,803 tons of ore have been crnshed, at a cost of $28,506.16, or $10.17 per ton, including all expenses, hauling, etc. The central shaft is now in good working order, extracting abont 200 tons of ore per day. The new shaft is at present 300 feet in depth, and a contract has been made to sink it 80 feet deeper, to correspond with the 430-feet level in the central works. The body of metal recently found in the eastern air shaft—430 feet level—is said to look encouraging.

Savage was sold at $1,310@1,300 per foot, and closes at abont $1,300. The old officers of the company have been chosen to serve anotber year. The different levels in this mine show a decided improvement, and the product of ore will be materially increased this month.

Crown Point declined from $1,240 to $1,190, rose to $1,210, then fell to $1,145, rose to $1,200, and closes at $1,190@1,185. The Rhode Island and Crown Point Mills are now reducing some 45 tons of ore per day, mainly taken from the 230-feet level. The drift west from the shaft, at a depth of 300 feet, is now in some 40 feet. An assessment of $100 per foot was levied on Thursday last.

Belcher has been in rather better favor, advancing from $870 to $935, then selling at $855, and closing yesterday at $860 bid. About 100 tons of low-grade ore are now daily taken from the old works, and a small vein of good ore bas been found in the north end of the 300-feet level, within 40 feet of the Crown Point line.

Hale & Norcross has been dull and inactive, and small sales were made at $490@500, then at $480 and $490, closing at $480.

Ophir was actively dealt in, and 75 feet were sold, declining from $350 to $290, rallying to $325, dropping to $280, seller 30, and changing hands yesterday at $275@285. A meeting of the stockholders was held on Wednesday last to legalize the present debt, and to authorize additional expenditures if they may be found necessary in the prosecution of their suit with the Moscow company, and the more thorough development of the mine. An exhibit was made, showing the present cash liabilities of the Ophir Company to be $68,000 We are informed that this does not include a floating indebtedness due attorneys and others, which, however, will probably not exceed $15,000, and is not immediately payable. The condition of the company's affairs in December last was substantially as follows: In the treasury, $10,817.75; materials on band, such as salt, quicksilver, wood, chemicals, etc., at the two mills, worth $105,000; ores mined and at the mills ready for reduction, valued at $48,200 net, together with 4,000 tons of low-grade ore on the dump, valued at $10,000; in all, $174,017.75. The cash materials on hand and the ores mined at the present time are valued at about $60,000. Notwithstanding the receipts of bullion have amounted to some $350,000 since December 15th, the company have consumed materials worth $114,000, and are now in debt, say $83,000. In other words, to produce $350,000 bullion, to pay legal expenses and explore the mine for new bodies of ore, an absolute loss of $200,000 has been incurred in about nine months. An assessment of $100 per foot was levied yesterday.

Chollar rose from $485 to $500, fell to $490, and closed yesterday at $480. Potosi rose from $430 to $460, receded to $450, and sold at the close at $440@420. The joint product of these two mines now average some 125 tons of ore per day. Work upon the magnificent new shaft of the consolidated company is progressing vigorously, and a depth of nearly 300 feet has already been attained. The winze under the Bajazette chimney is looking better, and the fifth station of the Potosi, running north, producing splendid ore.

Imperial opened at $248 per share, fell to $245, rose to $262½, declined to $250, rallied to $256, and sold yesterday at $250@253. In all, some 810 shares were dealt in. At a depth of 600 feet, a drift some 120 feet distant from the shaft in the new or sixth level has met with ore similar to that found in the middle body of the fifth level, and the air shaft snuk from the latter level a distance of 65 feet, is also in gu good ore. These developments are thought to indicate, with some certainty, the existence of as valuable a lode of metal at a depth of 600 feet as has been met with in the different levels above. The middle body of ore in the 530-feet level now furnishes most of the ore hoisted to the surface, and still shows a pay vein some 50 feet in width. The southwest deposit, same depth, in the direction of the Bacon mine, has improved, and is now nine feet wide. The east body, in stopeing up at the south, is also looking better, and promises to extend across to the north liue again.

The crushing capacity of the Rock Point mill is to be increased this month to 70 tons per day. in lieu of 50 tons, as heretofore. This will enable the company to reduce some 3,000 tons of ore per month, at their two mills. A dividend will be declared next week for the month of August.

Uncle Sam receded from $212½ cash, to $185, seller 30, and sold yesterday at $190@189. Overman has been moderately dealt in at $200@192½, closing at $190.

Bullion rose to $170, buyer 30, fell to $155, rallied to 160, and closed yesterday at $160. Confidence is in better favor, rising from $120 to $136 per share, aud held at the close at $130.

Daney fell from $75 to 37, and sold yesterday at $41. Sierra Nevada has been quite active, and some 2300 shares were sold, rising from $24 to 32, dropping to 23, and closing at $19. Burning Moscow closes at $26; North America at $25; and Exchequer at $39.

The aggregate sales of Stocks, siuce Saturday last, amounted to $972,527.

And in accordance with law, and an order of the Board of Trustees, made on the 1st day of August, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Tuesday, the 19th day of September, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. KOENIG, Secretary.

Office, 304 Montgomery street, San Francisco. sep2-3w

La Favorita Mining Company, Moctezuma District, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of August 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable on the 31st day of August, 1865, in United States gold coin, to the Secretary, 429 Sacramento street, San Francisco, Cal.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 30th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

E. WASSERMAN, Secretary.

Office, 429 Sacramento street, San Francisco. se2

Porter Gold and Silver Mining Company, Virginia District, Nevada,

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of July, 1865, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 531 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 30th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of October, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. W. WESTON, Secretary.

Office, 534 Clay street, San Francisco. jy22

This assessment is re-advertised on account of omission to advertise the delinquent list at the proper time. By order of the Board of Trustees.

C. W. WESTON, Secretary.

San Francisco, September 1, 1865. se2

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicant for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

St. Clair Consolidated Silver Mining Company, Smoky Valley District, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 31st day of July, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares	Amount.
W Beck	39 40	200	$100 00
James Phelan	48	200	100 00
J D Boyd	45	200	100 00

And in accordance with law, and an order of the Board of Trustees, made on the 1st day of September, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction at the salesroom of Edwards, Olney & Co., No. 626 Montgomery street, San Francisco, on the 16th day of September, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

AUG. KUNAST, Secretary.

Office, 540 Washington street, San Francisco. se2-3w

New Volume
— OF THE —
Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 61 columns (size of Harper's Weekly).

PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers, 505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and Newsdealers, acting as our agents, will receive liberal commissions.

☞ BOUND VOLUMES FOR SALE.☜

SUBSCRIPTION IN ADVANCE.

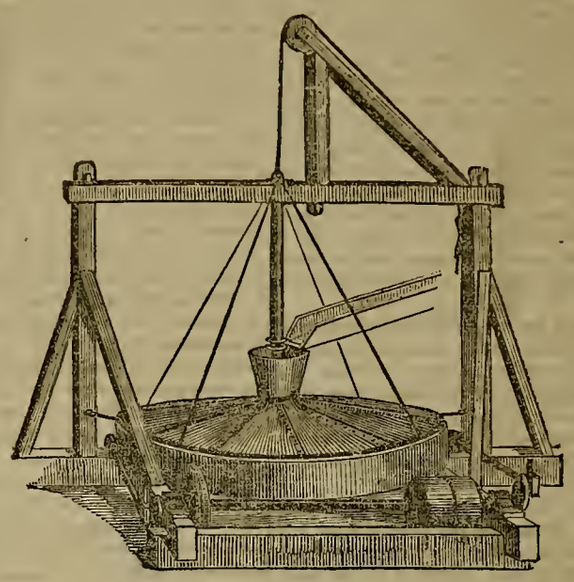
GOLD AND SILVER ORES.

UNDENIABLE FACTS FOR THE MINING PUBLIC.

At the Exhibition in the Fall of 1864, the Mechanics' Institute awarded a Premium to

E B. PRATER,

FOR THE BEST CONCENTRATOR.



The proprietors of this Concentrator feel satisfied that IT HAS NO EQUAL IN USE. Large numbers of these Machines are now in successful operation in all parts of this State, Arizona, Nevada, Colorado and Mexico. The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentroting and saving the sulphurets, and is to be placed behind all or any other machine in use.

One of these Concentrators can be seen in operation at Messrs. Kimble & Murphy's Metallurgical Works, Bryan street, between Third and Fourth, San Francisco.

Circulars sent free, giving description and reference as to working, etc., on application to

FURNITURE HOUSE OF GOODWIN & CO.

A stranger, visiting San Francisco for the first time, and looking around the city, usually expresses surprise, mingled with admiration, that a community with so brief a history should have arisen to such vast importance in the commercial world. The extent of the city, with its boundaries reaching across from the bay to the sea; and from the promontory that forms its eastern limits, back to the cemetery; comprehending in its embrace thousands of square acres of territory, and over one-tenth of a million of population, is itself a marvel; but when the great amount of shipping in the harbor, the immense trade conducted by its merchants and the superior articles of goods demanded for the Pacific market, are all taken into consideration, the mind is staggered to understand by what process such splendid results are attained, and to dwell with rapture upon the praises of a people who could have accomplished so much in so remote a part of the world, under the numerous local afflictions with which they have from time to time been visited.

Some of our mercantile establishments conduct a business which demands the use of millions of capital annually. We have our extensive importers; our manufacturers in all departments of industry; our inventors; and have become a self-sustaining State, with many articles in excess of the demand, for exportation.

This is a subject that contains a volume of matter. At this time we propose to speak only of one house, which confines its operations to trading in furniture, to give our readers some idea of the enormous consumption in that branch of labor alone.

The furniture establishment of Goodwin & Co. was opened in this city May, 1851, in connection with Geo. O. Whitney & Co. The present firm dates from 1857, and is composed of two persons, to wit: J. P. Goodwin, of San Francisco, and P. B. Holmes, of New York. There are three leading branches to the establishment: one at Boston, another at New York, and the third in San Francisco. The Boston and New York houses do most of the manufacturing for the San Francisco branch; shipping their articles out in the piece, and devolving upon the partner here the duty of putting the goods together, and finishing them up ready for sale.

There are two main salesrooms to the San Francisco branch of the establisbment of Goodwin & Co. One is located on Washington street, at 528, and the other on Market street, 636. There is also a salesroom at Sacramento city, and another large branch at Portland, Oregon. In addition to these places of business, there is a manufacturing house at 508 and 510 on Washington street, with three stories; the rooms having each a frontage of 30 feet by a depth of the entire length through to Jackson street. Each room is subdivided into workshops, with 85 men employed to erect and finish off the furniture. Four or five ladies are employed in the sewing department. The first room in the order of subdivision is used entirely for setting up cabinet work; the second for making and stuffing mattresses, where there are piles of hair, pulu and moss; the third is occupied as a picking department, where, by the use of machinery, the material used for stuffing the mattresses is cleaned; the fourth is devoted exclusively to upholstery; the fifth is the upholstery manufacturing department; the sixth is the rubbing and polishing department; the seventh and eighth, the flowing and varnishing, or final finishing department. All the labor is performed with the regularity of clock-work. An order, no matter how extensive, can be filled in any given time, and the goods turned out in fine condition for shipment.

The extensive cellar of this building is completely packed with furniture in boxes, as they were received from the New York and Boston houses, ready to be finished when the demand renders that operation necessary.

The firm of Goodwin & Co. have also two capacious store-houses on Battery street. One of these (No. 615) contains four stories, including the cellar, all of which are so densely crammed, from floor to ceiling, with furniture, that only a narrow passage-way remains for the removal of the goods.

The second store-room on Battery street (No. 621) contains three stories, every room of which is similarly packed with furniture. It is estimated that these various store-houses contain, at the present time, not less than six hundred thousand dollars' worth of furniture.

The sales of the house of Goodwin & Co., including only the California branches, amount to between six and seven hundred thousand dollars per annum. For the city trade alone they keep six teams constantly running to deliver furniture.

Visitors at the Pavilion of the Fair, are lost in admiration at the beautiful display made by the firm of Goodwin & Co., but it forms a very meagre feature when compared with the elaborately carved, highly ornamented and elegantly finished cabinet-ware which may be seen on taking a walk through the capacious rooms of their splendid establishment.

The reputation of the Goodwin & Co. firm for liberality and honorable dealing, has become well established. Their immense trade is not merely the result of fortuitous circumstance or good luck; but has been built up by industry, close application, and a thorough knowledge of the furniture business in all its various departments. It is rarely that a house can succeed in the conduct of so many branches, with such a vast capital at stake, exposed, as all heavy business houses must necessarily be, to the contingencies of flood, fire, shipwreck and failure, which are daily liable to occur, not only to their patrons, but in a more direct manner, to themselves. Yet this firm has grown and expanded gradually, until its history is such as we have narrated; and has the proud satisfaction of finding itself at this time in the confidence of the people, and with a patronage as extensive as its immense capabilities can well supply.

Artificial Legs.—"Go it, ye cripples; wooden legs are cheap," was a cant phrase when the old style of artificial limb was in vogue, such as formed one of the pedal extremities of Mynheer Vonclam und Peter the Testy. Well they might be cheap, for any good mechanic, with a drawing-knife and handsaw, could make them. Not so with the beautiful artificial leg known as "Palmer's Patent," and for sale by James Jewett, 629 Washington street. A man who uses one was heard to say the other day, that the fit was so exact, the motive power so easy, and the symmetry of these legs so perfect, that if he should lose his remaining "peg," he could part with it with but little regret, knowing how easy it would be to get a better one!

Challenge Accepted.—The proprietors of the Excelsior Pump accepted the challenge issued by Mr. Thomas Hansbrow for a comparison of merits. A trial for supremacy between the pumps of the separate parties, on a wager, will take place as soon as preliminaries can be arranged.

Elegant Printing.—The Commercial Steam Printing House of Francis, Valentine & Co., turns out certainly some of the finest executed job work in the world. The art of printing could hardly be used in more forms of neatness or beauty. Their business cards, bill heads, mining certificates, and cards for commercial houses, exhibit all the rare taste and elegance of style peculiar to the highest perfection of the craft. They print in all colors and modifications of colors, according to the chromatic process and in alternate lines. But to be appreciated their work must be seen, at 517 Clay street. Entrance also at 510 Commercial street.

Family Groceries.—The "corner grocery" is an institution in these days, and in a large city, as necessary as any other comfort which belongs to the family. Every immediate want of the kitchen can be supplied at short notice by calling upon it, and the "pass book" takes the place of small change, in the absence of such currency. C. J. Hawley & Co., 42 Second street, corner of Jessie, advertise to deliver the best of groceries, at cheap rates, in all parts of the city.

[From the Daily Fair Press, Monday, August 28th.]

Elegant Goods.—The ladies must not fail to visit Kirby, Byrne & Co., 7 Montgomery street, if they wish to have their eyes and hearts delighted. The array of silks, satins, dress goods, shawls, cloaks and cloaking, sheetings, linens, and all other elegant fabrics in the dry goods line there to be found, cannot fail to elicit their admiration. Perhaps no finer assortment is to be found in the city, which abounds with the most costly and beautiful of foreign and domestic fabrics.

Photographs.—In the art gallery of the Pavilion, the large photographs of Mr. Wm. Shew attract a great deal of attention and admiration. The countenances which they delineate are natural as life. As parlor ornaments, in the elegant frames where they are set, they are equal to the finest steel plate engravings, while they have the superior advantages of possessing the features and expressions of those who are near and dear to us. The show window of Mr. Shew, on Montgomery street, is an art gallery in itself. His photographic establishment is quite extensive, and we are pleased to know, yields a handsome revenue to its proprietor.

Door and Sash Factory.—The rapidity with which San Francisco extends beyond the sand hills, shows that a vast number of buildings are constantly being erected. These are adorned with all the modern exterior and interior decorations of popular architecture. The doors, windows, sashes, architraves, casings, pilasters, columns, cornices, capitols, and other adjunctive features to the main edifice, in our times, are manufactured separately, and procured to order and pattern. Robinson & Chapman, 30 and 32 California street, are prepared to fill all such orders promptly and handsomely They should be encouraged as "home manufacturers."

In Style.—Passing along Kearny street last evening, we noticed a large crowd of people standing around McGann & Co's hat store, No. 645 Washington street, near Kearny; we rushed furiously to the spot, thinking we had some awful tragedy to record, but fortunately, on inquiring, we learned that McGann & Co. were about to issue their new style of fall hat, for which the excited crowd were leaving their orders. The style is faultless, and no man who cares for his personal appearance will do without one. We advise everybody to call and see for themselves. Don't forget the number, 654 Washington street.

A Rejected Picture.—One of our local artists put himself to some trouble in painting "Rubens' Wife," only to have it rejected, on account of the scant apparel with which he clothed her. Rubens, during his day, was fortunate enough to have had two wives, Isabella Brants and Helena Forment—the last a great beauty. It was Helena, no doubt, that our artist has personated in oil colors. His reading of history must be somewhat defective, if he supposes ladies in the beginning of the sixteenth century, like the Georgia Major, preferred ventilation to respectability, and received calls from their gentlemen friends attired only in spurs and shirt collars!

We would call the attention of our friends and the visitors to the Mechanics Fair to the advertisement of W. G. Weir, furniture manufacturer, in another column. Mr. Weir is one of our oldest furniture manufacturers on this coast; in fact, we may say with propriety the oldest, having commenced in 1858, and carried it on successfully ever since. It is with pleasure that we refer to his efforts in this branch of home industry,—for by his quiet unassuming business manners and practical mechanical skill, in getting up good substantial work, the most prudent consumers *now* give the preference to the home made furniture. Mr. Weir's principal workshop and warerooms are at No. 638 Market street, near Kearny.

Photographic.—A series of views of the interior of the Pavilion were taken this morning by Mr. N. M. Klein, to be photographed.

Gov. Perry, of South Carolina, says when Gen. Johnston surrendered his army he had on his muster roll seventy thousand men, but only fourteen thousand to be carried into battle.

[From the Daily Fair Press, Tuesday, August 29th.]

THE MACHINERY DEPARTMENT.

Heretofore our duties have been of such an incessantly routine character, that we were not enabled to give that attention to separate objects on exhibition at the Fair, that we should be pleased to have done. A mere superficial examination of the machinery department is liable to lead one into the grave error—as we confess it did us—of supposing this branch of industry but poorly represented. The contrary is true, as we have since ascertained, by devoting a couple of hours to the inspection and enumeration of useful inventions under cover of the Pavilion. Last year the heavy machinery was in the main hall of the Pavilion, occupying a conspicuous place; and from the immense bulk of a few of its articles, gave them the appearance of being greater in number than they actually proved to be. The present year the heavy machinery occupies a department specially erected for its accommodation; and although the additional building is spacious, it is found to be quite inadequate to the wants of exhibitors in the various branches of mechanical industry. Many useful inventions have been crowded out and must be sought for in the main Pavilion, where they are found scattered about, occupying such chance places as were assigned them under the pressure of circumstances.

A walk of an hour round the mechanical department, will afford the visitor opportunity to observe that there is a vast amount of machinery represented at the Fair. Practical miners will be pleased to notice the numerous improvements in quartz crushers and processes of amalgamating ores. He will have an opportunity to witness the performances of the various mills and pans, among which are Bargion & Johnson's Eureka Crusher, Hinkle's Amalgamator, Strong's Union Amalgamator, Baux & Guiod's Separator and Amalgamator, Hunter's Concentrator, Amalgamator and Separator, Brodie's Crusher, Rix, Logan & Co.'s Hammer Battery, Hauscom's Crusher (two models), Knox's Amalgamator and Separator, Varney's famous pans, Prater's Concentrator, Beach's Improved Quartz Grinder, Stetson's self-operating Amalgamator, the Excelsior Grinder and Amalgamator, and Bruckner's immense furnace for roasting ores. There are several splendid pumps to be seen—Hansbrow's celebrated Challenge Pumps (several patterns), Hooker's Patent Excelsior Pump, which he is willing to match against the Hansbrow invention; Harrison's Eccentric Pump, which throws a fearful stream of water; Stoddard's Steam Pump, P. Donahue's Safety Steam Pump, and Fire Engine and Paxon's Garden Pump. There may be found also, the Turbine Water Wheel (various sizes), Tyler's Improved Water Wheel, Low's Grain Separator, Hunter's Grain Separator, the splendid steam engine from the Union Foundry of Booth & Co., which propels the heavier machinery; a smaller sized double piston engine (beautiful model), from the Vulcan Iron Works, which assists in propelling the Fair machinery; Dougherty's saw for sawing soapstone; Doane's Improved Portable Hay Press, Mock's Rotary Folding Hay Press, Steen's Engine, on a new principle, from the Novelty Iron Works, White's patent Boot Blacker, Hecker's Lathe for turning iron and a turning machine to manufacture pins for ship carpentering.

In the main hall there are numerous ingenious inventions, smaller in bulk and more elegant in finish, than those we have named. Among these may be named Squarza's Improved Faucet, Squarza's Essential Oil Extractor, Frink's Improved Soda Fountain, several small models of steam engines, self-coupling cars, a life raft, a machine to peg boots with brass screws, etc., etc. There are four or five wine and cider presses, several washing machines, two or three patent clothes wringers, patent stoves, lamps, etc., etc., to say nothing of the sewing machines, which are always objects of interest.

Let no one who visits the Fair, and expects to be profited, fail to look around among the machinery. Other objects may be more beautiful, but these are of greater practical utility.

SIMPLE BUT EFFECTIVE.

At the present time when the whole mining interest of the State is suffering from the effects of a well founded complaint that the cost of extracting the metals from their ores leaves but a small margin for profits, in consequence of the insufficiency of the processes employed for their extraction, the discovery of any method or any machine that will remove the cause of this complaint, becomes a matter of great importance, not only to those directly concerned in mining operations, but to the people of the Pacific coast generally.

Baux's first premium Separator and Amalgamator is, by many, regarded as the nearest approach to perfection, in this requirement, yet introduced. Simple in its operation, constructed on principles the soundness of which are apparent to every one competent to compare the cause of an action with its effect, its results are demonstrative of its efficiency. Though but little more than a year since first introduced, it has been thoroughly tested in various parts of this State and Nevada, and with every description of ore—from adamantine quartz, containing coarse gold, to the difficultly managed tight sulphurets and chlorides and other complex ores of silver; and in every place where it has been used, we are told, it has given the fullest satisfaction—to the validity of this claim the increasing orders for these pans testify. We think nothing more conclusively demonstrates the correctness of the principle on which Baux's Separator and Amalgamator is constructed, than the fact, which is so very apparent at the present exhibition, that while all the best of the pans —those made by the most famous inventors— have been changed more or less to conform to the principles forming the chief characteristic of this invention, namely, to prevent the mercury being ground with the ores. Baux's Separator and Amalgamator remains unchanged in every essential particular.

It is claimed for Mr. Baux, who is a learned French mathematician and machinist, who first demonstrated the advantage of retaining the mercury on the outer edge of the pan— and by the centrifugal motion of the mullers to inject the particles of metal into it for amalgamation, a principle so correct and effective that the wonder is that it had never been discovered before.

We have made many inquirers in relation to these pans, from millmen and miners in various parts of the State in which they are in operation, and the general reply has been that they are what their inventor claims for them— one of the most simple and effective amalgamators ever introduced. In that section of Nevada County in which are located those rich deposits of hard cement containing gold, known as the blue gravel lead, many claims that could derive no profit by working this cement with ordinary mills and pans, are extracting large quantities of gold with Baux's Amalgamator.

At Maltman's celebrated chemical works, near Grass Valley—where hundreds of tons of sulphurets are annually operated upon to obtain their gold by the chloriation process—this pan has made the product of the operation considerably larger. At Gold Hill, Nevada, where a number of these pans have been used for months—on trial in every case the mill-owners have ordered sets of them—till at present the orders from Nevada alone reach nearly seventy. At a meeting of a number of mill-owners assembled for the purpose of testing the efficiency of the various pans at present in use, Baux's Amalgamator and Separator obtained two and one half ounces of amalgam from 400 pounds of pulp that had passed through a famous pan—which grinds the mercury with the ore! Comment on such a fact—which may at any time be tested—is quite unnecessary. We are not writing this article to extol Baux's Amalgamator and Separator beyond its merits, or to disparage any other pan, but to convey information to our readers on an important subject, and as an act of justice to the inventor of a really valuable machine.

EDITORIAL BANQUET.

The Executive Committee of the Fifth Fair of the Mechanics' Institute, anxious in some manner to testify their appreciation of the efforts made by the press of this city to advance the interests of the Fair, extended to its representatives, on Monday evening, at the Pavilion, a grand banquet. Some thirty or forty guests were present, exclusive of the Committee, and inclusive of the members of the editorial fraternity. Mr. Charles M. Plum, President of the Institute, presided at the head of the table. The *Bulletin* was represented by Messrs. Snow and Gross; the *American Flag* by Messrs. Bennett, Wilson, and L. P. McCarty; the *Call* by Mr. McGrow; the MINING AND SCIENTIFIC PRESS by Mr. Ewer; the press at large by Messrs. Campbell and Bausman.

At eleven o'clock, P. M., the guests were seated to as sumptuous and savory a repast, we venture to say, as has ever been served in this city on any occasion at all similar. The caterers were Messrs. Swain & Brown, of the branch restaurant of the Pavilion.

After the removal of the cloth, cigars, "champagne and cognac" were introduced. The genial influence of these inspiring liquids soon manifested itself. Gentlemen who professed not to be eloquent or gifted with vocal powers, discovered that they had somewhat underrated their own abilities. Sentiment, wit, eloquence, and song, were the consequence. Measured utterance and frigid courtesy were soon changed to convivial mirth and enjoyment; corks popped, glasses rattled, and the toast, the speech and the song, went round until an hour that might have been termed decidedly late, when the company reluctantly separated with expressions of mutual respect—protesting officially, individuality and collectively, that a more delightful occasion had never been experienced, than that to which the night and the generosity of the Executive Committee of the Fair had given birth.

CIDER VINEGAR.—Families who make their purchases indiscriminately, are subject to have impositions practised upon them of all kinds, and in nothing more than the article of vinegar, of which there are many spurious and poisonous brands in the market. Muriatic acid, combined with coloring barks, in numerous instances, form the base of these poisonous vinegars; and when they are consumed incautiously, produce nausea at the stomach, followed by vomiting, and it may be permanent sickness, if not death. The importance of procuring vinegar in its purity, it will thus be seen, cannot be overrated; and in that view, we cordially recommend an article manufactured by Mr. Wheeler Martin, southeast corner of Second and Howard streets, from pure cider, as not only entirely innocent in its effects, but nutritive, if vinegar in any form can be said to possess nutritive qualities.

THE RECEIPTS.—The gross receipts of the Fair, including Monday evening, amount to $21,890.40.

[From the DAILY FAIR PRESS, Thursday, August 31.]

DUNBAR'S SELF-ADJUSTING STEAM-PACKING. Samples of this valuable article will be found on exhibition near the large engine at the Pavilion. In fact it is used in the very cylinders of that grand motor. As we have before stated, this packing is not a new thing, it having been extensively used throughout the United States, and is generally acknowledged by engineers, who have the most practical information of its working, to be the best in use. It works well in the cylinder, with less friction than the old style of packing, never leaks, and is easier adjusted. It is fitted in so as to leave no ridges, each piece lapping over the other. The saving of fuel by the packing is great, and as an important auxiliary to steam engines has a renowned reputation. One of its superior points is the fact of its fitting itself by wire so completely to its position, notwithstanding any little deficiency which may exist in the smoothness of the piston to which it is applied. It is exhibited by Henry S. Smith, of the Golden State Iron Works, whose advertisement appears on our last page to-day.

HUNTER'S CONCENTRATOR, AMALGAMATOR AND SEPARATOR.

One among the first objects of interest that arrests the attention of the visitor to the pavilion of the Fair, in the department of machinery, is the above-named machine, invented by Mr. Andrew Hunter, of San Francisco. To miners and millmen, it possesses virtues which commend it in an especial degree, and it is more particularly to the attention of such that it addresses itself.

The advantages claimed for this machine over all others by its inventor are: simplicity of construction; adjustability for all the different kinds of metals, for fine or coarse sands or pulp; the complete separation of the sands from the free gold and the sulphurets, each being deposited in their proper place; and the small amount of power required to run them— one-sixth of a horse-power being sufficient for one machine.

The capacity of this machine is equal to the working of seven tons of crushed rock per day, being an amount equal to the working of a five-stamp battery. It saves all the sulphurets, free gold, and wasted amalgam, on its copper plates, without any appreciable waste. One cubic foot of tailings from the concentrator, carefully panned out by hand, gave one-fourth of an ounce of very fine sulphurets and sands, which amount was found, upon assay, to contain two-fifths of clean sulphurets; indicating that the loss of sulphurets per cubic foot of tailings from the concentrator was about one-tenth of an ounce.

This machine was patented May 23d, 1865, and has been thoroughly tested in the Princeton Mill, working the full amount of rock above mentioned, and furnishing in every particular the highest satisfaction. The public have a fair opportunity to examine the sulphurets extracted from the tailings at the pavilion. We have been shown zinc sulphurets from a hundred pounds of tailings sent from New York to be worked on this machine. The result was certainly all that could have been expected, and, as we are assured, met with the unqualified approbation of those who were having the test performed.

As Hunter's Concentrator, Amalgamator and Separator is now being built, the plates are two and a-half feet wide by five feet in length, giving twenty-five square feet of copper plate in front of each battery. Those who are familiar with the different processes of working mineral-bearing rock, and have witnessed the results obtained by this machine, have spoken of it in the highest of praise. Our innumerable mines of silver, gold and other valuable ores, can only be brought into the market and made to yield a profit by modes of working which will insure a saving of all, or nearly all, the mineral contained in the rock. There have been a large number of machines before the public professing to attain this end; but trial has proved that they were inadequate for the purposes intended, and they have been abandoned. In fact, the history of *failure* has so often been written that a piece of mechanism of real merit now finds difficulty in finding lodgment in the public favor. This is very natural; but the inventor of this machine speaks with such confidence of its abilities, and exhibits such incontestible proofs of its superiority, that we are bound to believe it all that it professes, and therefore hope that neither he nor we, nor the world at large, may be disappointed. An amalgamator that will save two-thirds of the gold or silver in rock, is a great benefit; but that which will save all that is otherwise wasted—as Mr. Hunter contends this machine will—is a positive blessing.

VISIT FROM THE SCHOOLS.—The pupils of several of the public schools made a visit to the Fair yesterday. Mr. Stratton, who commanded the brigade (which numbered several hundred children of both sexes), took occasion, after forming the scholars in line, to address them a few words of caution about handling the goods, and then led them to all parts of the spacious hall where objects of interest were to be seen. Aunt Susan, of the New England Kitchen, entertained a portion of the children at her tables, and had occasion to compliment them on their good behavior.

COTTON MANUFACTURING.—Speaking of this business, the Newburyport *Herald* says it has not been so good for a long time as now. There is not a spindle or loom in the country that would not be put in motion if skilled labor could be had for that purpose. Some of the mills in Lowell and other places are at a stand-still for want of help, and three hundred operatives are needed in this city to day. The help cannot be had, though the mills are sending runners all over the North and into the British Provinces to collect them, and weavers earn a dollar a day. Weavers are most in demand; other departments can more easily be supplied. It is calculated that one-third of all the weavers have died, been married, or otherwise passed out of the business since the war began, and the factories have ceased teaching others. Some have gone into the woolen mills, or learned to run sewing machines in the shoe, hat, and clothing factories, and others have been taken in other ways, so that not more than half a supply can be had. If the mills could have help as the business now is, they would soon make up for the losses of last Winter.

A LOOK INTO THE FUTURE.—In the debate in the House of Representatives on the Niagara Ship Canal, Mr. Littlejohn concluded his speech as follows: "Now, sir, twenty-five or fifty years hence, from the Atlantic to the Pacific, will be a continuous tier of States, members of the Union, and over those States will run the iron horse of the Pacific Railroad. Members who reside on the far western coast have also an interest, then, in this highway. The products of Asia, wafted over the Pacific ocean, and then by rail can be shipped upon the waters of Lake Michigan, and pass to the Atlantic by this great improvement, and the merchandise of Philadelphia, Baltimore, of New York, of Boston and of Portland, will be sent westward over these waters, and will find a way to the coast of the Pacific, and even to China and India, for sale and consumption. And not only that, sir; the time is coming, within the next half century, when this republic will dictate laws, not only in the arts and sciences, but in pecuniary matters, to the whole world. The moneyed center of the whole world is to be transferred from English to American soil, if we are but true to ourselves and use and develop the resources and advantages bountifully bestowed upon us by nature. England must abandon her lines of communication with her eastern possessions and become tributary to the lines we propose to construct between the Atlantic and Pacific. Her business men and emigrants seeking China and India must cross our continent and pay tribute to our enterprise and the genius of our institutions."—*Traveler.*

THE WINE BUSINESS.—The wine business of the State is rapidly on the increase. The grape crop, especially in the vicinity of Los Angeles, is said to be better than it was last year, yet so great is the demand for grapes for the purpose of making wine, that they are selling on the vines this season at $1 25 per hundred pounds, while last year the maximum price was only 50 cents per hundred. So far as this State is concerned, it is stated as a fact that the native wines have pretty near driven all the cheap foreign wines out of market. In addition, the demand for California wines in the Eastern States is said to be rapidly on the increase. If it were not for the high rates of money in this State, the production and export of our wines would be trebled in three years. As it is, the business shows a gratifying increase.

THE WEALTH OF TRINITY CHURCH.—Trinity Church, New York is about to come once more into possession of its landed property, and its rent will enable the society to get along quite comfortable. The land originally covered 2,098 city lots, of which, since 1848, 318 have been given away, 1,059 have been sold, 691 are still owned by the church. Most of these lots are leased to other parties, but the lease will soon expire, and Trinity will then have about $20,000,000 worth of real estate. John Jacob Astor was shrewd enough in 1776 to obtain leases of 336 of these lots for ninety-nine years at 75 cents a year for each lot. It has been a very pleasant amusement lately for Mr. William B. Astor to pay over annually $252 to Trinity and receive for the use of the property about $168,000. But Mr. Astor's leases will expire next year, and he will not be able to renew the leases on such favorable terms.—*Hartford Post.*

THE *Frontier Scout* is the title of a little newspaper just started at Fort Rice, Dacota Territory, by the officers of the garrison: Captain E. G. Adams, editor. It is the only paper published within thirteen hundred miles of that point.

THE operative carpenters and joiners in London are endeavoring to obtain an advance the present rate of wages—33s. per week, 7d. per hour.

During the Fair

We hope the readers of the MINING AND SCIENTIFIC PRESS will look with leniency upon any degression they may observe from the usual contents and make-up of our journal. Correspondents will also please bear patiently with the crowded state of our columns in giving full reports of the Exhibition.

OUR PAPER BY EXPRESS.—Owing to the fact of Wells Fargo & Co requiring publishers to pay 2½ cents per copy in advance on papers sent to subscribers in the interior we are obliged to make our subscription terms by express $6.50 per annum.

[From the Daily Fair Press of Wednesday, August 30.]

TRIAL TRIP OF THE FIRST HOME BUILT LOCOMOTIVE, "CALIFORNIA."

The trial trip of the splendid new locomotive, manufactured at the Union Foundry of Messrs. H. J. Booth & Co., made this morning on the route of the San Francisco and San Jose R. R., affords an opportunity, while noticing the excursion, to say a few words in relation to the establishment where it was fashioned, Of late years, such a degree of perfection has been arrived at on this coast, in the construction of all kinds of machinery, ponderous and otherwise, that we have not only ceased to look to the Eastern cities for our supplies, but to regard their manufactures of inferior quality, as compared with similar articles turned out from our own workshops. The extensive works of Messrs. Booth & Co., are located on First street. The buildings cover a large space of ground, in which their own castings are made, and their own work performed in all the departments necessary to build a steam engine, a quartz mill, a water-wheel, an amalgamator, a force pump, or any and all other kinds of iron, brass or copper mechanism from the crude material, and with a compactness of form, extent of power, durability of parts, and elegance of finish, nowhere to be surpassed.

The last, and perhaps the grandest, triumph of mechanical skill emanating from these works, is the immense locomotive, turned out a few weeks ago, and which to-day made its trial trip on the track of the San Jose Railroad.

The cylinders of this locomotive are 16 inches in diameter, with a 24 inch stroke ; the driving wheels 5 feet in diameter, length of locomotive 26½ feet over frame; diameter of boiler 44 inches, containing 141 two inch tubes, 11 feet in length ; total weight of locomotive 30 tons. The manner of fastening the cylinders to the frames is entirely new ; they being so placed that they can at any time be removed without interfering with other working parts of the machinery. The adoption of this plan is original with Messrs. Booth & Co. The locomotive is supplied with a cone grate, used to prevent the heated coals from scattering along the track. The best of material has been used in its manufacture, and great care has been exercised, that its workmanship and finish should be perfect in every respect. It is no egotism for the builders to claim for it superiority over the Eastern build of locomotives ; for our California mechanics rank among the best on the continent.

The train, comprising three fine passenger cars besides an elegantly arranged smoking car, dashed off in splendid style at half-past ten. The party invited consisted of between two and three hundred ladies and gentlemen among whom were Gov. Low, ex-Gov. Stanford, the President of the Central Pacific R. R., H. M. Newhall, President of the San Jose R. R., and other prominent guests. A fine band of music was also in attendance.

The train proceeded to the big trees, some 30 miles, where the liberality of Messrs. Booth & Co. prepared a fine banquet, with an abundance of creature comforts, well flanked with good cheer, to which, after a little exercise on the light, fantastic toe, the company sat down with a good appetite. After the wines were properly disposed of, the health of Mr. Booth was proposed by Dr. Isaac Rowell, who, after making a few appropriate remarks, introduced Gov. Low.

The Governor, in the course of his remarks, paid a deserved compliment to Messrs. Booth & Co., as the builders of the first locomotive proper, which has ever been constructed in California, and the performance of which today has most agreeably surprised every one of the large company who were witnesses of her trial trip, and among whom were some of the first mechanics in the State.

Gov. Low was followed by ex-Gov. Stanford, H. M. Newhall, Prest., and J. T. Doyle, Vice Prest. S. F. & S. J. R. R., I. M. Scott, under whose supervision this splendid specimen of mechanism has been built, Mr. Bishop, the mechanical superintendent of the road, and several other gentlemen. Gov. Stanford gave us much practical information about the progress of the Pacific R. R., and Mr. Scott concerning the building of locomotives in California, which we hope to present our readers at an other period.

The time was thus delightfully and profitably spent, until word was given that the train was ready for the return trip.

The engine was under the management of Mr. Bishop, than whom no better engineer or mechanic can be found in the State. During his speech he told us that on the return he should prove her capacity to drive the train at the rate of sixty miles an hour. He did better, and at one time drove it two miles in 108 seconds—a fraction over sixty-six miles an hour, making the best time yet accomplished this side of the Rocky Mountains. Thus happily our first locomotive proved perfect, and nothing occurred to mar the harmony or pleasure of the excursion.

Had not the necessities of the Company required that this engine should be placed immediately on the road, it would have been allowed to occupy a place in the Pavilion during the present Fair ; although that could not be, it is still none the less a portion of the mechanical exhibition of our State for the present year ; and as such shows a most notable degree of progress, and may be looked upon as the inauguration of a branch of business in that direction, which is soon destined to become second to no other on the Pacific coast.

We regret that time will not allow us to speak more at length on the occasion of this important era in the mechanical history of our State, but as it is we must be content to give thus briefly the first printed report of the trial trip of the first regularly built California locomotive.

THE Colfax party will carry home with them to the Atlantic States, specimens of those splendid mammoth blankets made at the San Francisco Mills, with cloth to make each a couple of suits of clothing beside. These mementoes of California skill, we are informed, were presented by Mr. McLennan, one of the proprietors of the mills, and a gentleman famous for his generosity. They will not suffer in comparison with similar fabrics manufactured in any other part of the known world.

THE FIRST CALIFORNIA MADE WATCH ON EXHIBITION.—We would call the attention of our readers to this exquisite piece of workmanship, consisting of a lever watch, made byMr. N. F. Mitchell, of this city. It is made from nickel ware, is full ruby jeweled, and may be found in the Art Gallery of the Pavilion. Mr. M. deserves great credit for this fine specimen of mechanism, and we trust that he will receive more than a passing notice at the hands of the committee.

ARRIVAL OF OIL FROM THE SOUTH.—Three hundred gallons of oil from the Minnie Lottie Petroleum Co'e springs, Los Angeles county, came upon the steamer Pacific last evening. This oil, it will be remembered, assays lubricating oil, 94.53—5.47 waste. This is the first shipment of oil from the south, and will, in all probability, somewhat divert public attention, which has heretofore been engrossed by Humboldt, in that direction.

LET US HAVE A TRIAL.—We have conversed with a number of the prominent pan and amalgamator proprietors, at the Pavilion, and all seem willing for a fair test of their machines. We hope the managers will take the matter in hand and immediately arrange for a general trial of mining machinery.

THOSE who talk most, generally talk to the least purpose. In society the greatest boree never strike oil.

From the DAILY FAIR PRESS, Friday, September 2.

HUNTER'S GRAIN SEPARATOR.

The importance to millmen, farmers and even dealers, in having the grain which they use or handle free from all kinds of foreign matter, is so self-apparent that no argument is required to establish the proposition. This cleansing process, which might, as a matter of necessity, be dispensed with in the mere handling of wheat, becomes indispensable when the wheat comes to be manufactured into breadstuffs. The question then arises as to the best, cheapest, and most convenient method of effecting this object of cleansing it. The many great improvements in all the other features of milling, renders it important that they also should be simplified, in order to dispense, as far as possible, the accumulated human labor. Several recent inventions have claimed to meet this object, without, as the inventor maintains, coming so fully up to the design as the machine of which we are speaking. Its capacity for cleaning is rapid, and can be regulated to suit the working results of the largest mills in use. Its simplicity of construction is such that it is impossible for it to get materially out of repair, and it requires no more power to work it than can be exercised by a boy of fifteen years of age. The power can be applied by hand, through the medium of the crank, or in any of the simplest modes usually adopted about the steam engine; several late improvements have been put upon the machine, by which its adjustment is greatly simplified.

Having been invited, by the inventor and proprietor, to witness the working of the machine, we speak from observation when we say that it operated to a charm. The wheat run through the machine—or rather, what seemed to be wheat—was about one proportion of wheat to three of barley, two of oats, and the balance in mustard seed and refuse. The separation was most complete. The whole grains of wheat fell into one compartment, arranged for its reception; the barley into another ; the oats into another ; the chess and imperfect grains of wheat into another, etc., illustrating in a positive manner, that the machine was what it professed to be—a Grain Separator. This result appeared the more remarkable from the fact that the material run through the hopper was a mass of *stuff*, rather than of grain ; and yet the wheat came out almost as completely distinct as though it had been picked out with the fingers.

The proprietor claims that it cleans more perfectly than any other machine on the Pacific Coast, while it sells for about one-half the price. A machine of his invention and manufacture, for a farmer's use, costs from $100 to $125, and for mill use, from $125 to $200 ; cleaning from one to two bushels of wheat per minute.

It will pay the visitor to the Pavilion of the Fair to examine this machine. It is of San Francisco origin, and must be admired for the facility and thoroughness with which it performs its work.

BRADLEY & RULOFSON'S PHOTOGRAPHIC DISPLAY.—Visitors at the Fair should not fail to examine the immense display of photographic pictures made by Bradley & Rulofson, the celebrated photographers. It is remarked that the collection of pictures exhibited by this well known firm is the largest and finest ever exhibited on the Pacific coast, and it is not only a credit to the enterprising artists whose handiwork they are, but an honor to our young and flourishing State. Many of the pictures are of distinguished citizens whose features are well known to the public. · Bradley & Rulofson invite the closest scrutiny and most critical inspection of their works of art, and well they may. Their productions do not appear to be the dull inanimate shadow, but the living person, and so perfect is the illusion that one instinctively leans forward to catch the words which apparently are about to be spoken. Every family should provide itself with a picture of each of its members, from the gallery of Bradley & Rulofson, which, as a constant reminder of the loved one, excels any other keepsake which can be devised. Their gallery is on the southwest corner of Montgomery and Sacramento streets, where visitors are always attended to personally by the renowned artists themselves, who guarantee in all cases to produce pictures,

"With skill so exquisitely wrought,"

as to give the most perfect satisfaction, and at such moderate prices as to bring them within the means of all.

FAILED TO AGREE.—At the meeting to-day, for arranging the preliminaries for a trial between the Hansbrow and Excelsior pumps, the proprietors failed to agree, the difference between the proprietors, we understand, being in regard to the kind of power to be employed—Mr. Hansbrow adhering to man power, and Capt. Cushing demanding steam, or other measurable power. We are sorry the trial was not arranged for. The public are anxious to see the power of these two rival pumps tested. Capt. Cushing now offers a challenge for any pump in the State of California, for the sum of $1,000.

AN ingenious pocket time-piece. "warranted to denote time correctly," is selling in Loudon for a penny.

LAWRENCE & HOUSEWORTH.—Of all our business houses, none has added more to the attractions at the Pavilion of the Fair than this. Their stereoscopic views have occupied a prominent position in the Art Gallery, and have never, from the time they were first introduced, remained five minutes of time without being occupied by visitors. Their other goods on exhibition have been equally objects of admiration. Notwithstanding the many beautiful and interesting articles they expose to view in their show-case, these form a very meager collection in comparison with what may be seen at their store, 317 and 319 Montgomery street. Optical instruments are their specialty; comprising spectacles, opera glasses, microscopes, magnifying glasses, surveyors' instruments, field glasses, etc., etc.; and then comes their stereoscopes of all sizes and descriptions, with thousands of views of the finest of California scenery, spirited caricatures, landscapes, historical personages, and incidents, groups, mountain lakes, views, and such other pictures and portraitsree as may possess a special or general interest to the public. Their extensive stock also includes engravings, photographs, cutlery, globes, and fancy goods of numerous kinds ; consisting, in the aggregate, a museum of elegant, useful, and ornamental goods, suitable to the California market and calculated, in some one or other particular, to please almost every taste, crude or cultivated. The visitor wishing to add to the ornaments of his center table or parlor ; the student seeking for information ; the surveyor or mariner in want of a superb sextant, compass, or telescope, the admirer of of the beautiful, and the professor of the useful, can each be suited, by calling at the establishment of this firm, if not in every case to purchase, in all at least to admire the many articles of skillful workmanship with which their shelves and show-cases are filled.

CORSICA.—A great portion of the immense quantity of honey consumed in France is supplied from Corsica and Brittainy. Corsica produced so much wax in ancient times that the Romans imposed on it an annual tribute of 100,000 pounds weight. Subsequently the inhabitants revolted, and they were punished by the tribute being raised to 200,000 pounds weight annually, which they were able to supply. Wax is to honey in Corsica as one to fifteen, so that the inhabitants must have gathered 3,000,000 kilogrammes of honey. When Corsica became a dependency of the papel court, it paid its taxes in wax, and the quantity was sufficient to supply the consumption not only of the churches in the city of Rome, but those in the papal States. Brittiany likewise supplies a great quantity of honey, but of an inferior quality to that of Corsica. The annual value of the honey and wax produced in that province is estimated at 5,000,000.

ITEMS WORTH COMMITTING TO MEMORY.—A bit of glue dissolved in skim-milk and water will restore old crape. Hull a cranberry bound on a corn will soon kill it. An inkstand was turned over upon a white table cloth ; a servant threw over it a mixture of salt and pepper plentifully, and all traces of it disappeared. Picture frames and glasses are preserved from flies by painting them with a brush dipped into a mixture made by boiling three or four onions in a pint of water. Bedbugs are kept away by washing the crevices with strong salt water, put on with a brush. Soft soap should be kept in a dry place in the cellar, and not be used until three months old.

NOT SO GOOD.—A young gentleman was paying special attention to a young lady, and one day a little girl, about five years old, slipped in and began a conversation with him : " I can always tell," said she, "when you are coming to our house." "You can!" he replied ; "and how do you tell it?" "Why, when you are going to be here sister begins to sing and get good ; and she gives me cake and anything I want, and she sings so sweetly—when I speak to her she smiles so pleasantly. I wish you would stay here all the while ; then I would have a nice time. But when you go off sister is not so good. She gets mad, and when I ask her for anything, she slaps and bangs me about." This was a poser to the young gentleman. "Fools and children tell the truth," quoth he ; and taking his hat he left and returned no more.

ZINC AND IRON.—A mixture of zinc and iron heated with ammonia and ammoniacal salt, rapidly disengages hydrogen, the reaction being tumultuous as the temperature rises. Nitrate of ammonia, however, in dilute solution, submitted to the same treatment, yields protoxide of nitrogen.

A GREAT flood in the district of Bertbier and Sorel, in Canada, recently, swept away houses, barns and stock, and drove the inhabitants into the tall trees. Many lives were lost.

DIET OF THE FRENCH WORKMAN.—He is up at dawn; in fact, everybody rises early in France. There is more business done before ten o'clock, in Paris, than there is in London before eleven. There are two places where breakfast may be had—the *cremerio* and the soup-shop. Some excellent coffee, with milk, costs less than one and a quarter pence; and the bread, with butter, one penny. For dinner, the soup will cost one and a half pence; the plate of meat, two pence; half a bottle of wholesome wine, four pence; or a quarter of a bottle, two pence; or a pint of beer or milk two pence—and all of a really good quality. In many places they give soup, a piece of mutton, or *boeuf a la mode*, bread and a half bottle of wine, for sixty centimes, or about eleven cents of our money.—*Traveler.*

LIFE INSURANCE CO.,

No. 240 Montgomery Street,

SAN FRANCISCO.

The Most Liberal Company

IN THE UNITED STATES.

All Policies Non-forfeitable and Indisputable.

No Extra Charge for Residing in the Territories, or for Traveling to and from the Eastern States.

J. A. EATON & CO.,

Managers of the the Pacific Branch.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our forme location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty Ove Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlerged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

"THOUGHTS AND THINGS"

APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the GOLDEN ERA.

SUBSCRIBE FOR THE GOLDEN ERA.

One Year.....$4 00 Six Months.....$2 00

To Mail Subscribers.

THE GOLDEN ERA for One Year.....$4 00
THE GOLDEN ERA for Six Months.....$2 00
THE GOLDEN ERA for Three Months.....$1 00

Sent from the Office to any Address in California and Oregon—Nevada, Washington, Idaho, Utah and Colorado Territories—the Atlantic States, Europe, and all parts of the World.

Take care to write distinctly the name of the person, the name of the city, town or locality where the post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

AGENTS in every part of the State receive subscriptions for the GOLDEN ERA.

POSTMASTERS in California, Oregon, and neighboring Territories obtaining subscriptions for the GOLDEN ERA and forwarding the same, with name and address of the subscriber, will be allowed a very liberal commission therefor.

Liberal Terms to Clubs.

Three copies, one year.....$10 00
Five copies, one year.....$15 00
Ten copies, one year.....$25 00

Now is the Time to Subscribe.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,

No. 543 Clay street, near Montgomery, San Francisco.

ANTIQUARIAN DISCOVERY.—The enormous gigantic pillar, standing on a sand hill in the outskirts of Alexandria, and commonly known as Pompey's Pillar, but recently regarded as the Pillar of Dioclesian, has long been a subject of interesting discussion to Egyptologists and historical students. Its appearance on a rude and very much broken foundation of many stones, was, to the eye, inseeure, and it looked much as if it would topple down. The period of its original hewing out of the Syrene quarry has been more uncertain than the date of its erection or inauguration in its present position. The foundation recently came to the notice of the Viceroy, and he ordered its repair. In doing this work it has been discovered that the visible foundation stones had really nothing to do with the support of the column, but were only the filling in around a cubic stone block on which the column rests its entire weight. On this block was found an inscription upside down, and investigation shows this to be an old capital from a column in one of the ancient temples in Upper Egypt. So that it is plain that those who erected the pillar of Dioclesian brought the capital to Alexandria for this purpose and the stone which was once honored as the crowning of a column in a temple of Sesostris on the Upper Nile, was degraded to be the hidden foundation of a column to the honor of a Roman despot. This stone bears the name of a king who lived about B. C. 1700, and the column has been standing on it fifteen centuries. The basement has been repaired, and there is now left a space so that visitors can walk around the old supporting stone and see the hieroglyphies on it.—*N. Y. Jour. Com.*

KEEP VALUABLE PAPERS IN PAPER.—At the burning of Barnum's Museum his iron safe fell in with the floors, and had to remain there in the fire a day or two. When taken out, everything covered with leather was destroyed! Everything covered with paper or linen was uninjured! The money in the leather wallet was burned up; that in a paper was safe. So with deeds, bonds, and other valuable papers.

WINE MAKING IN NAPA.—One cannot help noticing the constantly increasing extent of the vineyards in the county, and the large quantity of wine already produced. On a late visit to the cellars of Mr. Segrist, near town, we were astonished at the number of barrels now filled and ready for shipment. The wines made by Mr. Segrist are equal to the best we have as yet seen in this State, and the day is not far distant when Napa will rank as one of the leading wine-growing counties Mr. S. ships his wines direct to New York, where ready sale is found.—*Napa Register.*

REV. DR. BUSHNELL having expressed a very poor opinion of "that which claims to be a National hymn, entitled 'America,'" a friend of the author rejoins that he wrote the verses forty years ago for a Sunday school celebration, never claimed them to be a National hymn, and is not to blame because the nation will sing it.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

10v10

CHAS. A. JAMES.....AGENT

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 2v11qy

LEWIS COFFEY. J. S. RISDON
LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.
Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

GEORGE T. PRACY,
Machinist and Blacksmith.
STEAM ENGINE, FLOUR AND SAW MILL
And Quartz Machinery, Printing Presses,

GALLAGHER & WEED,
BRASS AND BELL FOUNDRY
And Lock Factory.

ALL KINDS OF BRASS AND COMPOSITION CASTINGS AND FINISHING DONE WITH NEATNESS AND DISPATCH.

CHURCH AND STEAMBOAT BELLS, OF ALL SIZES, made to order. Engineers' Gongs made and hung in the best manner. Bank, Vault, Store and Prison Locks; also Brass Padlocks and Shop Locks of various patterns, on hand and made to order.
☞ Particular attention given to casting Rudder Braces and Ship Work in general.
☞ All Jobs promptly attended to. Prices moderate.☜
No. 125 First street, opposite Minna next door to Pacific Foundry. 12tf
[Removed from Oregon street, between Front and Davis.]

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

Machinists and Foundries.
D. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.
UNION IRON WORKS!
Corner First and Mission streets,
SAN FRANCISCO.
ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.
Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.
Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.
Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wiklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,
Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.
We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron.
All work done in the best manner at the lowest cash prices.
21v10 H. J. BOOTH & CO.

MINERS' FOUNDRY
—AND—
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
☞ Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.
tf HOWLAND, ANGEL & KING.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.
IRON FOUNDERS,
Steam Engine and Locomotive BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,

Manufacturing Machinery of Every Kind.

Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR
BETTS'S AMALGAMATOR;
HERSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;
FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

☞ As a sample of our manufacture, we invite the attention of visitors at the Fair to our Double-piston Engine, by which the DAILY FAIR PRESS is propelled, in the Pavilion.

NOVELTY IRON WORKS,
Steam Engine, Boiler and Machine Shops.

STEAM ENGINES AND BOILERS, OF ALL KINDS, ON hand and Made to Order. Quartz, Saw and Flour Mills, and all other kinds of Machinery, made to order, bought, sold or exchanged.

Reynolds' Variable Cut-Off Saves from 25 to 60 per cent. of Fuel.

WINANS' ANTI-INCRUSTATION POWDER for Steam Boilers, a *SURE REMEDY*. Send for a Circular.

Mission street, between Beale and Fremont streets, San Francisco. qy29-4

"She Has It Bad!"—At least a dozen different remarks, rich and ludicrous, were made by many of the Mormons and the Mormonesses while witnessing Mrs. Julia Dean Hayne in the character of *Camille*, the evening of her first appearance here. Unused to the simulations of the stage, and—with not a few—for the first time in a theater, the unlettered immigrants from the pauper preeints of the Old World, were no more endowed with thinking power than to absolutely believe that the said artiste's *coughing*, as the "consumptive Camille," was *constitutionally* and *strictly real*. Said one old Welch woman within hearing, "Praise the Lord! It's too bad the President (meaning Brigham) would allow the dear, good lady to play to night, with such a shocking cough!" And, another, with an old fashioned hair-pin holding together a hoary head of hair resembling tow, forced her way from the rear, on to the stage, inquiring of the property man to let her see "that poor sick lady," that she might give her a few sups of herb decoction which she held in a bottle, that she "*knew* would ease the creature's throat." "What a pity the poor thing's so short of breath," said one; and "Dear me but *she's got it bad*!" said another consumption sympathiser!—*Salt Lake Vedette.*

Sulphur Works.—T. M. Boarman, Esq., arrived a few days since from the mountains, says the Red Bluff *Independent*, bringing specimens of sulphur and brimstone from Lassen's Butte, where, in conjunction with other gentlemen of enterprise he has erected machinery for the manufacturing of sulphur. The supply is inexhaustible, and sufficient to furnish the whole nation with brimstone.

How to Get Rid of Ants.—A correspondent furnishes the San Jose *Mercury* the following receipt: Buy two bits worth of tartar emetic; mix it with sugar, either in powder or dissolved in water, and place it out of the reach of children, but where ants will be likely to find it; and in less than three day's they will all have left your premises.

A few weeks since, a returned soldier purchased a new pair of boots at a store in Buffalo, and left his old ones, but some time after returned and called for them. When they were brought to him he ripped open the lining and took from beneath $1,550 in greenbacks, in denominations of $50, $500, and $1,000, which he had placed there and forgotten.

About fifty thousand dollars' worth of worn-out fractional currency is destroyed each day, and its place is supplied with new. The entire amount in circulation is upward of $21,000,000. No more three cent notes are to be issued—the act of Congress prohibiting them—and the five cent notes will also be withdrawn.

HENDY'S

IMPROVED BLOW-PIPE.

This Convenient Helpmeet

— TO THE —

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the Press of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

Our Circulation.—The Mining and Scientific Press has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Progression in the Old World.—Gradually the nations of the old world are adopting the liberal views of the new, and it will not be long before many of the wholesome laws of the United States for the protection of the poor and the relief of the unfortunate, will find recognition and acceptance in Europe. In England, France and Ireland a feeling is rapidly growing in favor of abolishing imprisonment for debt, and another year, it is confidently asserted, will find laws in existence forever doing away with this barbarism. The Lord Chancellor of England prepared and submitted to the last session of Parliament a bill for the repeal of all laws for imprisonment for debt, and the Emperor of France has recommended the enactment of a similar measure. The proposed Act abolishes arrest for debt both on final judgment and *mesne process*, but while the person of the debtor will be free, the most stringent remedies are given to reach his property, no matter where or how circumstanced. It provides that a discharge shall not free the debtor's future acquired property, unless his estate pays five shillings in the pound, or unless *bona fide* creditors to the amount of three-fourths of his debts shall, by writing under their hands, consent to an absolute discharge by which he shall be released. This is a short step, but it is in the right direction, and will be followed by others in closer keeping with the progressive tendency of the times. The stocks, the whipping-post and imprisonment for debt, have given place to homestead and bankrupt laws in the United States, and enlightened Europe blushes at the barbarous laws upon its statute books which republican America has pronounced unjust and oppressive. The next popular movement in Europe, after the abolishment of imprisonment for debt, will be for the exemption of household furniture and homesteads from execution. Before this measure may become a law in France and England, however, new and startling innovations upon the legal practices of the Old World will be ventured in the United States—possibly, in many of the States, the abolition of all laws for the collection of debts ordinarily occurred. The world moves.

The restriction of twenty-five per cent, on cotton, west of the Mississippi, has just been removed. Thus all cotton is free with the exception of the internal revenue tax of two cents.

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of July, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, by Messrs. Edwards, Olney & Co., 826 Montgomery street, San Francisco, on the 21 day of September, 1865, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. WARREN CLARK, Secretary.

Office, 410 Montgomery street, San Francisco. au26-3w

Wisconsin Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on September 17th (Sunday)—changed to Monday, September 18th, 1865, at 10 A. M. of said day.

au12-4w J. WARREN CLARK, Secretary.

Whitton Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Tuesday, September 5th, 1865, at 2 P. M of said day.

au12-4w J. WARREN CLARK, Secretary.

Wide West Gold and Silver Mining Company, Silver Mountain District Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Thursday, September 7th, 1865, at 2 P. M. of said day.

au12-4w I. S. BROWN, Secretary.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Amador and Alpine counties and the State of Nevada.

Thos. Poyzer, of Grass Valley, for Nevada, Yuba and Sierra counties.

TOPOGRAPHY AND HISTORY OF AUSTIN.—Gov. Bross in his letter to the Chicago *Tribune* says: "Austin, a city of three thousand inhabitants, is situated in a valley running out at right angles into the Toiyape mountains that bound the valley of Reese River on the east. The mines were discovered in the Spring of 1862, by a driver of the Pony Express by the name of Talcott. He came up the valley to get some wood for the station of the Express Company, located in the valley below. The city was not fairly commenced till the Spring of 1863, and to build up such a town with mills and stores and dwellings, and to develop the mines as we have seen them, seems more like some strange fable than an absolute reality. In no other country are such miracles of enterprise and industry performed."

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trimmed.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-qy

OIL WELL BORING.

J. SEVENOAKS,

Contractor

For Well Boring and Erecting all kinds of Machinery connected therewith.

Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1229 San Francisco. 2v11

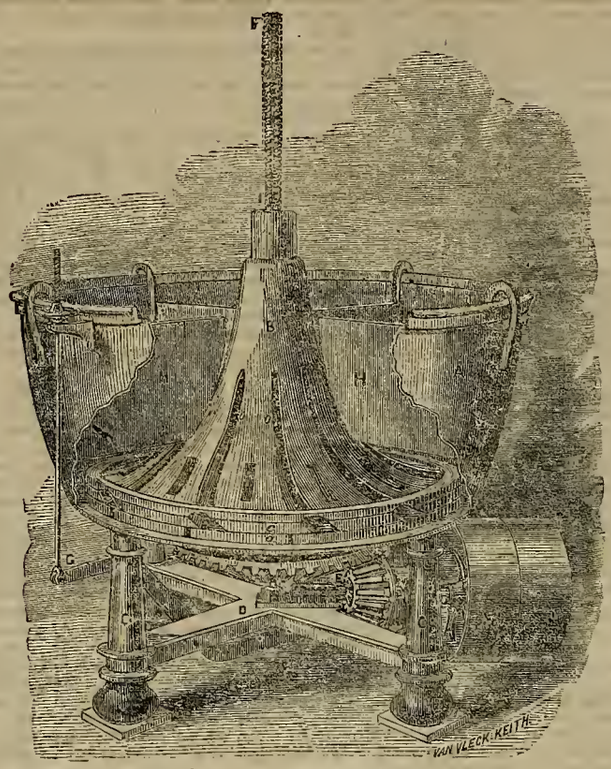
The claims of this Company consists of SIX HUNDRED AND FORTY (640) ACRES, situated on Kellog Creek, in the Marsh Creek Mining District, Contra Costa county, Cal.

One thousand (1,000) shares of the contingent fund is offered at the low price of ONE ($1.00) DOLLAR per share, full paid, all the stock being unassessable. All who wish to purchase, or make any enquiry concerning the Company, will please call on the Secretary,

J. M. BUFFINGTON,

2v11 Corner of Sansome and Washington streets.



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity, "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

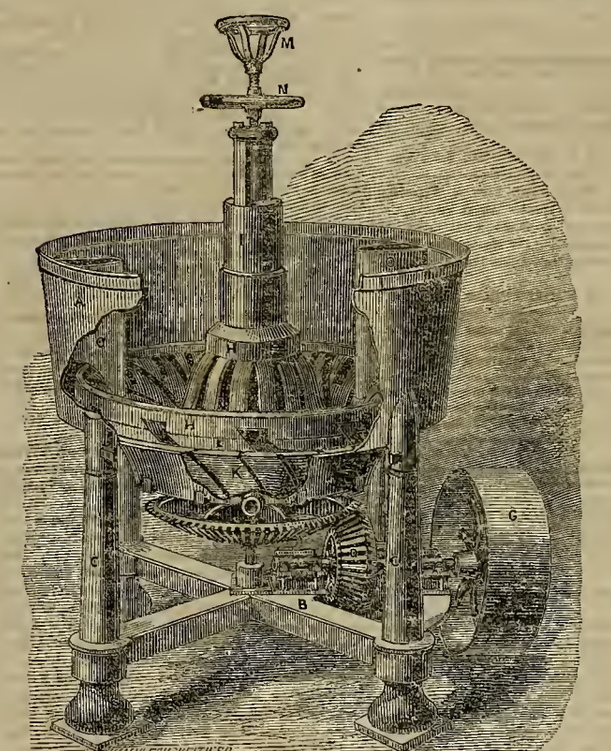
Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.



THE WHEELER & RANDALL Grinder and Amalgamator.

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

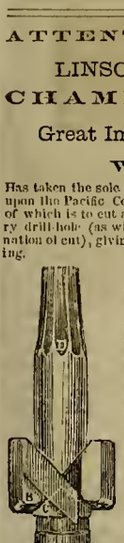
Machinery.

ATTENTION, MINERS!
LINSCOTT'S PATENT
CHAMBER DRILL.
Great Improving in Blasting.
W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.



D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¾ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. (Illustrated in the Mining and Scientific Press, April 9th, 1864.)

HEPBURN & PETERSON.

nov8 3m*

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Funchery's survivalled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1863; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

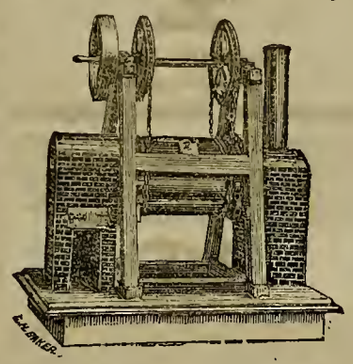
B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, concentrate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,

24v9

W. BRUCKNER,
MINING ENGINEER,



Begs leave to call the attention of the mining public to his apparatus for ROASTING SULPHURETS, one of which is now being exhibited at the Mechanics' Fair. Parties wishing to test their ores by this roasting process are requested to leave their orders at the MECHANICS' FAIR DAILY PRESS office. 7df

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apertures and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,

1v1 San Francisco.

VALUABLE
PATENT RIGHT
FOR SALE.

The patent right for the United States of a valuable invention can be secured at a bargain by applying at this office. The article is one of general application throughout civilization.

DEWEY & CO., Publishers.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.

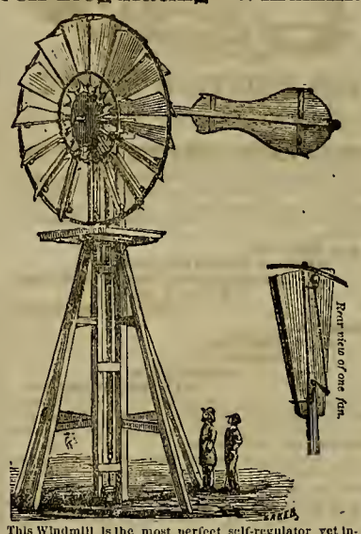
Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.

21v10 RIX & LOGAN.

ATWOOD'S
Self-Regulating Windmill.



This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in orderly almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT.

7v10 23 Second street, San Francisco

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE.

The DOUBLE TURBINES, so long expected, have arrived at last, and orders can now be filled. We have a large supply of the different sizes, from 20 inches to 30¾. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

The above Wheel will be exhibited during the Fair of the Mechanics' Institute, where all may see it and hear its merits explained. This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS.

4v11-tf Care RICHARDS & MCGNOGHEN, San Francisco.

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson-lan Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waitman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honest and competent, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against the subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected therewith it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we a cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the nventor should be engraved or painted on it cousplenously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5.

HELMBOLD'S
FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Orgauic Weakness, Debility, Female Complaints, Etc

H

HELMBOLD'S
FLUID EXTRACT BUCHU
—AND—
Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

E

USE HEMBOLD'S
FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu
IS THE GREAT DIURETIC.

L

HELMBOLD'S
HIGHLY CONCENTRATED
Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Mr. Geo. M Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the Mining and Scientific Press at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "Stockholder," No. 72 William street.

Our Paper by Express.—Owing to the fact of Wells Fargo & Co requiring publishers to pay 2½ cents per copy in advance on papers sent to subscribers in the interior we are obliged to make our subscription terms by express $3.50 per annum.

[From the Daily Fair Press.]

THE TURBINE SCREW PADDLE WHEEL.

This new and important California invention begins to attract considerable interest and attention, both here, at the East, and in Europe; and should its performance on a large scale realize results foreshadowed by the tests and experiments hitherto made, we may confidently anticipate a speedy revolution in the steam navigation of the world. Probably none of the wants of civilization has received more earnest study and attention, or enlisted a greater amount of genius than this subject of the paddle wheel, and perhaps nothing has been so little improved.

When we reflect that the present method of propelling vessels by the use of paddle wheels is six hundred years old, without a single successful effort to displace it, notwithstanding its acknowledged imperfections, we may well entertain an honest pride if it has been reserved to California to discover the desideratum of a propelling instrument that works and harmonizes with the laws of nature.

We have been familiar with the theory of this invention for several months, and are entirely convinced that it embodies a great truth, and is destined to accomplish a revolution in favor of speed, with a great economy of power: and at least one strong moral argument in its favor is that the absence in this wheel of all the formidable impediments of the present theory, were incidental to the construction of this instrument upon principles that it was believed would envoke a new element of power, and the various experiments and tests to which the turbine screw has been subjected have fully vindicated the theory, and realized the expectations of its friends.

The exceeding simplicity of the invention renders its application easy and inexpensive, and may well have excited doubts as to its novelty; but we understand that a year's investigation and correspondence has failed to discover anything like it, or even attempting the acquisition of the great central element of this invention, which would seem to hold within its orbit a solution of all the difficulties hitherto encountered in attempts to improve an instrument that (if the new theory be correct) was wrong in principle, and hence no amount of treatment could reach its chronic defects. The peculiar angular and curved form of the floats or buckets of the new wheel, appear to hold in combination a remedy for the violence of the present wheel, while the soft and noiseless angular action on the water develops a latteral pressure that is ever present, no matter what the speed, securing to the new wheel a resistant, after all pressure is lost in the vertical action.

A moment's reflection must convince the most sceptical, that if it be possible to substitute constant pressure for the violent percussion, lift, and consequent vibration of the present method, a great point will have been gained; as it must be apparent that concussion retards momentum, and all power thus consumed is worse than wasted, saying nothing of the disastrous effects upon the duration of the vessel.

In the angular or turbine wheel, we find gentleness combined with power, and while the floats or buckets enter and leave the water without violence and without disturbing the water next the hull of the vessel, discharge the displaced water to the outside, at an angle avoiding back water. Experiments have proved that the effectual propelling power exerted is much greater than is obtained from the present method, while the slip of the wheel is greatly diminished and power economized.

All the experiments made have indicated a difference in favor of the turbine screw of fully fifty per cent., with an actual increase of speed at the same revolution, of over twenty-five per cent., as will be seen by the subjoined statement of the comparative results:

Distance 855 feet.

Two Old Style Wheels, two men.....	54 seconds.
Two Turbine Wheels, two men.....	37 "
One Turbine Wheel, two men	54 "

Tests were also made between the power of the turbine wheels and that of the oar. Boats lashed stern to stern, one man on the crank and two men with four oars, when the wheels towed the row boats ashore easily.

The new wheels, we trust, will be tried shortly on a large scale, when we shall look for results that will secure their immediate adoption.

A patent has been applied for by the proprietors of the wheel, Messrs. E. Jones & E. C. McComb; Mr. Jones being the inventor. Its model is among the latest entries made at the Fair. It is located in our department of models, and attracts much attention.

A Profitable Gold Saver.—It is not the amount of money made that renders the individual wealthy, but rather the sum which he saves. So in quartz mining, the mills which reduce the most rich rock are not always the ones which prove most profitable. Usually, the most clearly productive machinery is that which is so simple in construction and working as to require but a small outlay of capital and a limited amount of power and attention. As a sample of this latter class of machinery, we would mention Hungerford & Hendy's Prater Concentrator, of which we have before had occasion to speak in terms of recommendation. These concentrators are placed as gleaners after batteries of various construction and are apparently steadily gaining favor, some fifty of them having already been put in use in various localities. Most of our prominent foundries and machine shops have engaged to construct them, and the following list are now in the process of manufacture: Three for Mexico, at the Union Foundry; four at the Fulton Foundry—two being for the Union mill, in El Dorado County; six at the San Francisco Foundry, two being ordered for the Buell mill, Austin, Nevada, by J. R. Murphy, an experienced metallurgist who has had the concentrators in practical use for the last twelve months. The machine is constantly in operation at the Pavilion, where we would invite millmen to examine it and obtain further information from the attendant proprietor Mr. J. Hendy.

Gunpowder.—"In time of peace prepare for war," and "be sure and keep your powder dry," are injunctions which have passed into proverbs. The California Powder Works, for which John F. Lohse is acting agent, are now manufacturing extensively. These works are located at Santa Cruz. They turn out sporting, mining and blasting powders, in quantities to supply a large demand; and on account of the peculiar claims they have upon the people of this coast, ought to be liberally patronized.

[Written for the Daily Fair Press.]

The Absence of Color in Leaves of Plants.

On a recent visit to the Pavilion, my attention was called by Mr. Bloomer, who has charge of the Botanical department, to a specimen of the red wood (*Sequoia Sempervirens*) of this State.

This specimen is peculiar in having one part of its foliage perfectly white, while the balance is of the usual vivid green. This is a condition which we often see in other plants, especially of the geranium family; yet not in so marked a manner. The question arises, what causes this departure from a regular law of nature?

We all know, if a plant is deprived of its proper supply of light, it will grow up pale and sickly, passing through all grades of color, from its normal green to a perfect white. Yet here is a plant which has not been subjected to this deprivation; growing out in the common light and air of heaven, exposed to all the usual conditions of plants, with one part of it green while the other is white. What is the cause of this? In no work have I seen an explanation offered, yet there must be some cause for it; nothing in this world is left to chance.

I propose not to give a theory, but rather to call attention to this phenomena, and offer a few points for the consideration of those who study natural history. The sap of a plant is blood, as the blood of animals is the sap of their organizations. The two fluids play the same economy in the law of nature. The blood of man, we know, has in it two kinds of cells, or corpuscles, the red and white. It is upon the proper adjustment of these cells that health in a great measure depends; if we have an over abundance of the red cells, the condition of plethora or hyperæmia is produced; and this gives us a standard, as it were, above health. If, on the other hand, the white cells predominate, there is a state of anæmia or paleness, being below the standard of health. In one case there is an over development of the circulating fluid; in the other an arrest of development.

Now, may not the same law influence the sap of plants? We know that the color of the leaves of plants depends on a principle called *chlorophyl*, as the blood depends on hæmatin for its color. That the leaves act as the lungs of the plant, that unless the sap has been exposed to the influence of the light and air, it is not suitable for the nourishment of the plant. Just as the blood is not capable of sustaining life until it has been ærated in the lungs. Now taking up the example of the blood and following it still farther, may not the sap have two kinds of cells, and that in a healthy condition of the plant the one proper to it predominates, and so the green color is produced. If now we have an unhealthy condition of a plant, or part of it, may not the other cells (being of a lower grade) be arrested in their development, and taking the ascendency, produce in the plant (as the underdevelopment does in the blood cells), an anæmic state; hence the white color.

My opinion then is that this phenomena is caused by an arrested development in the sap cells of the plants. Whether that arrestment is caused by external or internal influences, we cannot determine.

This is but a crude idea of what is in my mind in regard to this subject, and my only intention in this article is to direct thought to a thing we see every day, and yet for which we have no satisfactory explanation.

C. A. S.

San Francisco, Aug. 24, 1865.

THE EUREKA MATCH MANUFACTORY.

One of the most unassuming, but by no means least valuable, of the classes of manufactures which have lately grown up in our midst, is the manufacture of lucifer matches. Until quite recently the inhabitants of the Pacific coast have been supplied with this indispensable article wholly from the East, and the public were therefore oftentimes placed under a heavy contribution by speculators who managed to get control of the market. The introduction of their manufacture has not only removed this evil, but has also furnished us with an article altogether superior to the generality of matches brought from the East, and the market has been kept constantly and uniformly supplied. It is our purpose, in a future article, to give a succinct history of the match manufacture, the discovery of phosphorus, its application to the manufacture of matches, etc. For the present we have merely space to state that the application of phosphorus to the old sulphur match has entirely changed the character of that useful article, and introduced it at once into manufacture as a science, as well as an art.

The first application of chemistry to the discovery of a substitute for the tinder box of our fathers, was made in 1820, since which time there has been a continual progress in this art. In 1836 the lucifer match was first introduced, and these explosive matches were soon followed by non-explosive ones, and various improvements have been made in this direction, by different chemists, for the past twenty years; but no greater improvement has ever been made than that recently introduced by Dr. Lanszewcert, of this city, and for which he holds a patent. The match manufactured under this patent is called the "Pacific Safety Match or Light," in which for the first time in the history of this manufacture, *no sulphur nor ordinary or amorphous phosphorus is used, not even on the surface of the box.* The advantages of these matches cannot be overrated; for children can eat them with impunity, as they are harmless in their compounds. They are sufficiently combustible for all practical purposes, yet not so much so as to render them as liable as most other matches to accidental ignition; and last, though by no means least in their advantage, is their freedom from all source of injury to the health of those employed in their manufacture. These matches are on exhibition at the Pavilion, in the cases of Jessup & Co., of the Eureka Manufacturing Company. As a California invention, we would call the especial attention of the public to its novelty and utility; and we presume Dr. Lanszweert will be found entitled to the highest consideration of the examining Committee of the Institute for the same. Among other samples in the exhibition of Jessup & Co., we notice the California Ladies' Parlor Match, the Challenge Match, and imitations of every other description of valuable matches; all of which have been manufactured under the supervision of Dr. L., as the chemist of the Eureka Match Co.

California Straw Works.—Since the days of mother Eve, to the present time, there never was a greater variety of jaunty hats, caps, bonnets, and other decorative head pieces worn by the *gals*. To keep pace with their singular caprices in this matter, establishments have been erected to manufacture, remodel and amend for them. The Straw Works of T. Gill & Co., on Third street, is such a concern, where the darlings can have their bonnets, hats and caps pressed into any shape they may desire.

Descriptive Catalogue

—OF THE—

INDUSTRIAL EXHIBITION

Of the Mechanics' Institute, 1865,

COLLECTION OF MINERALS, ETC.

—INCLUDING—

Minerals, Mineral Oil, Fossils, Curiosities, Models, Etc.

Contributed to the Exhibition of the Mechanics' Institute of 1865, through the care of Dewey & Co., proprietors of the Mining and Scientific Press.

CONTINUED.

306 A. Graham, Puca Straits, W. T.: one piece Coal.

307 W. R. Frick, San Francisco: lot of Mineral Specimens.

This entry consists chiefly of different varieties of silver ore from Washoe; also, a specimen of lava and one of coral from the Sandwich Islands.

324 Thos. H. Morrow, San Francisco: one case Gravel Specimens, from the American North San Juan Co. Nevada Co., Cal.

This sample of specimens shows the character of what is called the cement gavel, which is found in such immense quantity through the larger portion of the deep hydraulic diggings of Nevada and Placer counties, and in other sections of the State where deep diggings occur. The samples exhibited are from the claims of the American Company, at North San Juan, Nevada county. They are kept in water to prevent them from slacking and falling to pieces by the action of the atmoshere.

426 F. Morris & Co., San Francisco: large specimen gold and silver bearing Quartz,

This massive specimen of gold bearing sulphurets is from Sandy Gulch, Calaveras county. It is indicative of a very valuable mine; but we have no farther particclas witb regard to its location und condition tban that which is giveu above.

484 Henry Ross, San Francisco: one specimen Silver Ore; one specimen Plumbago, from the Silver Era mine, Summit City, Alpine Co.

489 T. B. Cunningham, Secretary, San Francisco: two specimens Argentiferous Galena, from Emilia Mining Co., Mexico.

These blocks, one of about fifty and the other of five pounds weight, are beautiful specimens of bright argentiferous galena, from the Emelia mine, located in Guerrera, Mexico.

490 A. Layrus, Placerville: specimens gold bearing Quartz.

These specimens of rock. altbough tbey show but little gold to the uuked eye, are nevertheless said to he very rich. Tbe company owning tho ledge is incorporated under tbe name of the "Blue Ledge Quartz Mining Company," and is quite distinct from the Blue Ledge G. and S. M. Co. of this city. The richness of the rock warrants the expense of hauling it quite a distance for erushing. It is generally of a peculiar blue cast—hence the name of the ledge.

494 E. Wasserman, San Francisco: lot specimens of Ore.

498 Mrs. B. R. Blake, San Francisco: specimens of Stalactites.

These elegant specimens of stnlactites are formed in very much the same manner as icicles from dripping water in cold weather. The water in this case is charged with particles of lime, beld in solution; this water, as it trickles down from tbe walls or roof of the eave, gradually deposits its particles of lime, leaving them hanging in the form of stalactites from the rock. The water, thus dripping, sometimes also builds up a pyramid of lime from the surface upon wbicb it commences to drop.

514 C. T. Meader, Stockton: rich samples Copper Ore, from Calaveras and Amador Counties.

The above entry contains the finest samples of native copper and copper ore which has ever been seen in this city. They are from the "Union," Newton aud Cosumnes mines, in Tuolumne and Amador counties, the chief portions of which are owned by Mr. Meader, the exhibitor. Mr. M. has taken much pains to send them to this city as contributions to the mineral display at tbe pavilion. They are from his office collections at Stockton, whither they will be returned after the close of the exhibition. The cabinet specimens in the show-case are really elegant. Tho two samples of filiform crystalization, with their soft, massive and moss like aggregations, are perfectly *unique*. The samples of variegated ores in the same case afford a beautiful illustration of some of the processes of furnace crystalization, which take place under the action of the heat required to raise the per centage of the lower grade of ores to that represented by what is known as copper 'matte." Included in this collection is a large mass of very rich yellow sulphurets of copper, from the Union mine, a fair average of that class of ore, which weighs 1,205 pounds. This is, beyond doubt. the richest mine of copper in the world. There is also a massive specimen of the same class of ore, coated with black oxide, or perhaps a thin film of blue sulphuret, which must weigh nearly a thousand pounds. A very fine brick of smelted copper is also exhibited, from the Meader smelting works connected with this mine.

518 O. W. Easton, San Francisco: one Shell Fossil; one sample Coal, from near Mayfield, Santa Clara Co.

This coal is claimed by the exhibitor to be of true bituminous character, and being found in near proximity to the accompanying fossil, that fact is thought to be a strong indication of the presence near by of a genuine deposit of hard cannel coal.

519 E. D. Waters, San Francisco: specimens Gold Quartz, from Eagle Company, Amador Co.

525 Charles Beiderman, San Francisco: one tray and one box of Precious Stones.

Tbis collection is very interesting and attractive. It shows tho precious stones; first, as they are found imbedded in the containing earth, which is a trachyte of sedimentary deposition; second, the stone, liberated from the surround ng earthy matter, und then the same after it has passed through the lapidary's hand. and been cut and polished. The opal is a variety of quartz, being composed of from 88 to 91 per cent. of silex, and from 7 to 9 per eent. of water, with a trace of foreign matter, from which it chiefly derives its color. The color of the opal is white, yellow, red, brown, green or gray The dark colors are derived from foreign substances, such as iron, alumina, manganese, nickel, etc. It often exhibits a play of rich colors. The fine opal, the most precious variety, presents bright hyucinth, red and yellow reflections. The less common varieties are distinguished and valued by their degrees of transparency and lustre. The pure opal, when large, and exhibiting its peculiar play of colors, in perfection, is a gem of high value. It is cut with a convex surface. The largest opal known. is in the Imperial cabinet at Vienna, and weighs seventeen ounces. It is as large as a man's fist; it is quite imperfect, however, and is prized more for its massiveness than intrinsic value. The best pure opals are brought chiefly from Zimapan, Mexico, and from the Faroe Islands.

The opals now on exhibition represent several of the numerous phases which this variety of precious stone assumes under its different modifications. They are found on a mountain called Stockton Ridge, about a mile distant from Mokelumne Hill, and in a trachyte strata, deposited by running water, and overlying deep placer gold deposits, such as are usually known as "hydraulic diggings." in various parts of the State. They were first observed in the earth thrown up while sinking a deep shaft, and the strata in which they occurred was subsequently traced to its outcrop at the surface, a short distance from tho sbaft. Here tunnel operations were commenced, and it is found that the character of the stones improve in quality as depth is gained by going into the hill. They are found in three separate strata, about two und a balf feet tbick, altogether, but separated from each other by a small space of earth barren of precious stones. The most of the opals exhibited are found near the surface. There are several stones in this collection, however, apparently of the emerald variety. having a blue and greenish tint. These probably contain a noticeablo quantity of aluminum, and glucinum. The composition of this variety of precious stones, when approaching to their most perfect state, is about 67 per cent. of silex, 17 of aluminum, and 16 of glucinum. These stones are found at a much greater depth than the opals—at about 200 feet from the surface, and imbedded in a coarse gravel, cemented with blue clay. The proprietors of this claim are steadily at work developing the same by further explorations. They have much encouragement to do so from reports which they have received from a small sample of specimens which were sent to Paris, a few months since, and there submitted to the examination of European experts. The exhibitor, Mr. Charles Beiderman, corner of Howard and Third streets, is one of the proprietors of the claim, and bas done much in carrying forward the work of adding this new source to the already extended list of California's mineral productions. He intends soon to have his collection carefully examined by competent parties, and the various stones properly classified. This exhibition may be elassed as one of the most interesting in the Pavilion.

533 W. H. Martin, San Francisco: one barrel Benicia Cement; one box Cement Rock.

The operations of this company have fully proven that large deposits of genuine hydraulic cement exist on this coast, and that California need be no longer dependent upon the Rosendale cement for hydraulic mortar. No better "Roman cement" can be produced in the world than is being exhibited by the Benecia Cement Company; and it may be a matter of public interest to know that the company is now able to supply the fullest wants of tbe Pacific coast for this important article.

538 W. P. Patton: samples Copper Ore.

540 C. L. Taylor, San Francisco: specimen Crystalized Quartz, from Mexico.

A very fino crystaline deposit of sulphate of lime upon a base of metamorphosed trap rock.

544 F. R. Anthony, San Francisco: two specimens Copper Ore, from Campo Seco Mining Co.

These are very fine massive specimens of yellow sulphurets of copper; and give most unmistakable evidence of a heavy concentration of a most reliable vein of copper ore.

558 Sullivan & Cashman, San Francisco: twelve bars of Copper.

These bars of copper were smelted by N. Haskell & Co., of Mariposa county. Mr. Haskell claims to have produced the first bar of copper ever smelted in California. This is a portion of a lot of 138 bars (five tons weight), from ore from the Lone Tree and Dogier mine, in Hamilton district, Mariposa county. Messrs H. & Co. are now prepared to turn out from ten to twelve tons per week of copper bars of ordinary commercial fineness. These bars were from ores of carbonates and oxides, and were smelted at one operation. They possess the malleability, toughness and color of the ordinary imported article, and are about 96 per cent. pure. Tbis production. in connection with that turned out by Meader & Co., at Copperopolis, forms an important epoch in the progress of the metallurgical industry of California.

561 A. M. Ebbets, San Francisco: specimen Fuel Coal.

This specimen of coal, which weighs 150 pounds, and the one adjoining it, are both from the same locality. A close examination of these specimens will show the intelligent observer that they are quite superior to the common lignites. The proprietors are quite sanguine of eventually attaining, as depth is obtained, a very fair specimen of bituminous coal.

564 J. W. Reed, Simmons Springs, Colusa county: Remarkable Petrification, and specimens of Fossils.

The specimen marked A is a terebratella Whitneyi, Gabb, from the miocene tertiary formation.

B is an inoceramus piochi, Gabb. a fossil bivalve shell, from a cretaceous formation, and occurs in immense mountain masses.

C is an inoceramus cast occurring in a cretaceous formation. These inoceramı are of unusually large size for this species, larger than any ever beretofore found.

D is a specie of ammouite, from the limestone of Colusi county.

E is a very perfect specimen of the inoceramus, indicative of the cretaceous formation.

F Volcanic glass or "pitch stone" enclosed in trachyte.

565 O. Butterfield, Ashton, Colusa county: specimens of Native Copper; one Petrifaction.

The specimens of native copper and copper ore indicate a mine of extraordinary richness. This mine is located about twenty-five miles north of the Bear Valley oil district, has been opened at five different points, from ten to fifty feet deep, und shows a width of five feet at the latter point. The ore occurs mostly in bunches, no well defined vein having yet been discovered. Abont fifty tons of thirty to forty per cent. ore has been received from this mine. There are quite a number of other promising mines in the same neighborhood. The accompanying specimen in this entry is a calcareous concretion, formed in all probability over projecting roots or twigs, which have parted with their organic structure and themselves become changed to lime. From their separate crystalization they have to a great extent separated and fallen from their calcareous covering. It was obtained from Simmons' Springs, near Bear Creek.

566 Prof. W. M. Gabb, San Francisco: three Fossil's.

These beautiful and interesting fossils were found in Sbasta county, and are known, one as a Beterie, quite perfect, and a large fragment of the same; the other is a Ramosa. Two of them are curiously worked with, as it were, beautiful arborescent sculpture, which, however, is the work of nature, that has been accomplished in the long ages during which the shell, and the fish which once inhabited it, has been gradually transformed into silicious and calcareous matter.

569 Henry S. Macomber: specimens of Plumbago, from Eureka Plumbago Mining Co., Sonora, Tuolumne co.

These samples of plumbago appear to be of a very exeellent quality, and the mine is said to surpass in extent any similar mine in the world. Large quantities are now being shipped to the East, where the mine is obtaining much notoriety for its superior character and extent. The proprietors are thus opening up another important branch of our mineral resources, and adding still further to the wealth and commerce of the Golden State.

570 Flora Company, Florence ledge, Alpine county: lot of specimens.

These specimens are from the Flora company's claim, Florence Ledge, Alpine county, California. They eonsist principally of sulphurets of silver, with probably some chlorides. This ledge is offered for sale, through the exhibitor, who may be addressed at Placerville.

571 I. N. Thorne, Secretary of the North American Tin Company: samples of Stream Tin Ore, from Durango, Mexico.

This sample of tin ore, with the exception of the two large, angular fragments, is what is known as stream tin, and is washed from the river beds, being separated from the mass of earth and rocks by its specific gravity. This sample is variously made up of oxides, sulphurets, tin pyrites, etc. It is all very rich in tin.

572 A. Habich: Silver Ore from Columbus district, Nev.

This lot of ore is from the newly discovered mining region known as the Columbia district, situated about sixty miles east of Aurora, Esmeralda. The finer specimens of this ore are what is known as copper and silver glance, and are very rich in the latter metal.

573 Gold Point Ledge Mining Company: Samples of Ore.

These ores are from ledges located in Reese River, in Summit and Amador districts; several specimens of ores from the newly discovered Kearsarge district, to the west and south of Esmeralda, are also included in this exhibition.

575 A. S. Hallidie & Co., San Francisco: specimen of Atlantic Cable.

These sections show the manner in which the new Atlantic telegraph cable is made, and the manner in which the shore ends of the same are protected by an extra covering of stout iron wire. Sections are also exhibited showing the manner in which the coatings are built up in deep sea cables.

576 Dewey & Co., Mining and Scientific Press, San Francisco: lot of Specimens, Ores and Curiosities.

This entry consists of a variety of ores, fossils, etc., among which are to be found elegant crystals of rock salt, from a mountain of the same on the Colorado; crystals, almost pure, of native Alum; a beautiful crystal of Wolfram or tungstate of iron, a rare and beautiful iron ore, sometimes associated with tin; a small specimen of gold, of the rare and beautiful filiform order of crystalization, and entirely free from foreign matter, is also exhibited; also stephunite, a rich and beautiful variety of silver ore, containing about 18 per cent. of sulphur, and 10 or 12 of antimony. The only specimen of ore from all the rich and productive mines of Grass Valley are in this collection, and represent the recently opened, but very rich mines known as the "Lucky" and the "North Star." We have also here a very fine specimen of gold bearing quartz, from the newly discovered lode located about four miles from Strawberry Valley, Yuba county, contributed by Dr. L. W. French, of La Porte, Sierra county. The specimen is very rich, containing much fine gold. It was taken from a depth of 40 feet, ledge five feet wide. The rock is expected to average about $40 per ton.

577. Timothy Hinckley, Jackson, Amador county: one Gold Specimen, valued at $2,000.

The mine from which this specimen was obtained, is located in Jackson, Amador county, and was discovered two years ago, since which time $11,980 have been taken out. The gold chiefly occurs in pockets, from the largest of which $5,000 was taken. The last pocket yielded $500. The mine has been opened only seventy feet, and has widened from two to six feet in that distance. The pockets seem to be giving out in the depth, but the general indications for a paying mine are improving. The mine appears to be on a true fissure vein, the eastern hanging wall of which is granite, with a foot wall of slate. It passes directly under the house where the discover, Mr. Hinckly, bas lived for eight years. This specimen contains more gold than its appearance would seem to indicate. Its specific gravity—an unfailing index—is said to show its intrinsic value to be about $2,000.

598 William Williams, San Francisco: Specimens of Copper and Silver from the Sauce mine, Lower California, Mexico; grey copper ore from the Giantess mine, same locality.

This is an extensive and quite unique collection of copper ores, from Lower California. The ore containing native copper is from the Sauce mine, located about 200 miles above La Paz, and only sixteen milee from the port of San Bruno, where the steamer John L. Stephens calls on her trips up and down the coast. The most singular specimen in the collection is one containing both native copper with native silver. Such specimens are rarely found in any mine, although native silver and native gold has been found associated, and native copper in Plumas county, in this State. The gangue rock, like that of the La Vietoire, in Mariposa county, ie composed of a micacious talc, eontaining very little, if any, silicious matter, and ie, no doubt, of plutonic origin, indicating a true fissure vein. The native copper is mostly found in thin scales or sheets, the latter at times being quite massive. This very singular class of copper ore is well worth the attention of copper miners, as it differs so very much from the ordinary ores of copper that, unless very rich, it would often be passed over unnotieed by the prospector. There is a large bar of copper, weighing 64 pounds, taken from 140 pounds of this ore; also a smaller one, containing quite a noticeable quantity of gold, taken from ore from the same mine. Tbis vein has been opened to the depth of about 100 feet, at which point it is said to be sixteen feet tbick. There is also exhibited with this collection, and in the same case, a lot of very fine specimens of gray ore of copper from the Giantess mine, in the same district. The peculiar character of this ore renders it very difficult to arrive at a fair average of its assay; and as buyers here are unwilling to take much risk, the proprietors, finding themselves unable to obtain what they reason-

ably think n fair value for the ore, will hereafter ship it to Swansea, to be worked on their own account. The mine belongs to Capt. Wm. C. Hyde and W. H. Blossom, Esq., of this city.

621 Capt. J. M. Aiken, San Francisco. Two pieces of rich gold bearing rock, from Mariposa Co., Oak Mine, Hunter Valley; five pieces gold rock from the Western Virginia mine, Mariposa County.

These are very fine specimens of auriferous sulphurets in a silicious matrix, showing much free gold in immediate contact with the sulphurets.

629 H. G. Bennett, San Francisco: An interesting variety of Geological Specimens.

Included in the above are several very curious and rare specimens of asbestus, among which we may mention fibrous asbestus, mountain cork, and mountain leather; the two latter are so called from their close resemblance of the articles from which they are named. He also exhibits several specimens of very beautiful opalized wood, such as is often mistaken for the genuine opal itself. We have also crystals of copper formed by nature, and other crystals of the same metal formed by art, through galvanic agency, so nearly resembling the work of nature that one would be readily taken for the other. A specimen of genuine meerschaum, (silicate of magnesia), a California product, is also exhibited by Mr. Bennett; also several California rubies and opals, and a California diamond. There is also in this collection a specimen of "float stone," which will float upon the water—a variety of quartz arranged in fibres, or filimentary crystals, aggregated into a spongy or porous mass. This is quite a mineral curiosity. Several very fine specimens of chloride of silver, showing also native silver, are included with other minerals in this entry.

628 Dewey & Co., San Francisco: Curiosities.

We have in our collection, at the Pavilion, small particles of the famous Monitor, Ericsson's first turretted ironclad, and her rebel antagonist, the "Merrimac." The first is an iron specimen and the latter pine wood—each singularly emblematic of the result and fate of the vessels and the powers they represented. The samples are from our excellent friend I. A. Heald, machinist in the Washington Navy Yard and leader of the *American Brass Band*. The scrap from the Monitor is a portion of an iron splinter scaled from the plating by the heavy balls of the Merrimac. It was forwarded to us, by mail, at the time the former was being repaired at the Capitol Navy Yard, after its wonderful engagement at Hampton Roads. The wooden mite of the Merrimac is from a floating fragment picked up by the officers of the steamer Massachusetts, (directly after the blowing up of the defeated confederate craft by the rebels) and brought to the Navy Yard at Washington.

—

ADDITIONAL.

8 E. Vache & Bros., Los Angeles: one jar of Cream of Tartar.

This sample of Cream of Tartar, was manufactured by the exhibitor, at Los Angeles. San Francisco agency, 605 Sansome street.

219 J. C. Gaffin, San Francisco: Four specimens of Argentiferous Galena.

These elegant specimens of argentiferous galena are from Washington district, Lander County, Reese River. They are associated with lime, and are among the finest specimens of that class of ore in the Pavilion.

305 A. Graham, San Francisco: One specimen of Coal.

This is a specimen of a very superior character of lignite, and is from the same locality as its neighbor, No. 561.

339 L. C. Hunter, San Francisco: box specimens of Lava from Kilauea, Sandwich Islands.

These specimens are very neatly arranged in a case with compartments, covered with glass, and so disposed as to show very distinctly and beautifully the variety of color and form found in the eruptions from this celebrated volcano.

481 Henry Ross, San Francisco: Plumbago from the Silver Era mine, Alpine County.

The above specimen may be seen in Capt. Aiken's case, and was entered, as above, for "plumbago." On a careful examination however, it proves to be a sulphuret of molybdena, having the formula of sulphur 40 and molybdenum 60. It may be readily distinguished from plumbago by its making a greenish mark upon crockery, also by its giving off fumes of sulphur under the blow-pipe.

491 E. Wasserman, San Francisco: Samples of ore from Mexico.

These specimens consist of gold, silver, and copper ore combined, being an average lot of specimens from the La Favorita mine, Lower California.

519 Noble Oil Well Company, San Francisco: one jar of Crude Petroleum.

This oil is from the Noble Oil Well, on Mattole Creek, Humboldt county, and was obtained August 22d, 1865, at the depth of 168 feet. The specific gravity of this oil is 40°. It is considered a very superior article for crude petroleum.

521 Valparaiso Mining Co., by Henry N. Kemp: five specimens of gold bearing Rock.

These specimens are from Tuolumne county, and contain a notable quantity of sulphurets, rich in gold. In some of the specimens large amounts of free gold is visible.

622 Macdonald & Bro., San Francisco: one gold specimen from Williams Creek, Cariboo, British Columbia.

This specimen weighs a little over two ounces, and affords very good evidence of the existence of rich quartz veins in that region.

623 J. M. Aiken, Coulterville, Mariposa county: one specimen of Crystalized Copper, from Arizona.

This is a beautiful specimen of native copper, apparently passing into a red oxyd from atmospheric action. It is sometimes known as "tile ore." This oxyd is of a bright red color, and, when pure, is about 88.12 per cent of copper, while the black oxyd contains but 20.13 per cent.

624 J. M. Aiken, Coulterville, Mariposa county: one specimen Magnesian Wire: one Indian Spear-head.

This wire is the same that is used for producing the brilliant light, of which so much has recently been said, as one which may eventually be used for illuminating cities, light-houses, etc.; and which has been found to produce a photograph with as much distinctness as the light of the sun. When ignited it emits a flame of most intense brightness, throwing all other illuminating agents, except the electric light, quite into the shade. Mr. Keith, the apothecary, at 321 Montgomery street, has a quantity of this novel metallic illuminator on hand, the effects of which he will be happy to exhibit to such purchasers as may be curious to witness the same.

625 Chas. M. Plum, San Francisco: three specimens of Silver Ore, and one of Sulphuret of Mercury, all from Mexico; a mineral picked up on the Rocky Mountains—probably an agate in the rough.

The above specimens furnish the usual characteristics due to such minerals.

626 S. M. Lamborne, San Francisco: one piece of Live Oak having two barks.

627 H. C. Bidwell, Indian Valley: one box of specimens.

These specimens consist of gold bearing quartz, from five different ledges in Plumas county, representing the following companies: Right Stripe, McClellan, Creole, Union Mine, and the Eureka. They are not exhibited as rich specimens, but as average samples of ore taken out from the mines mentioned.

638 Kellogg, Hewston & Co., San Francisco: samples of Sulphate of Copper.

These specimens of sulphate of copper, the blue vitroil of commerce, are elegantly and tastefully arranged, in prisms, pyramids, etc., and make a fine show. The crystallization is very fine. This material is employed in dyeing operations, in the printing of cotton and linen, and for various other purposes in the arts. The samples on exhibition were manufactured by Messrs Kellogg, Hewston & Co.

615 Miss Plank, San Francisco: Specimens of Silver ore, and Silver Bullion.

One of these specimens of ore is beautifully bespangled with chrystals of stephanite, one of the ores of silver. The ore is from the Batosegachic mine, Chihuahua, Mexico, and is owned by Philip Plank, Esq., formerly of this city. The pure silver was run out from the ore in a common furnace, leaving the slag still rich in the precious metal.

652 Thomas Armstrong, San Francisco, late of Durango, Mexico: specimen of Tin Ore.

This ore is from near the same locality as that exhibited by Mr. Thorne, Secretary of the North American Tin Mining Co., Durango, Mexico. The company, of which Mr. Armstrong is a member, is known as the Durango Tin Mining Company; they hold a title to a tract of twenty five miles square, from both the Imperial and Liberal government in Mexico. The samples exhibited are mostly taken from the gulches, in nearly all of which this ore is found. These mines must soon become very valuable. The ore is of extraordinary richness, and abundant beyond precedent in the history of tin mines.

659 I. N. Thorne, Secretary, San Francisco: four bars of Metallic Tin, with samples of Tin Ore, from the North American Tin Mining Company.

These fine specimens of tin ore are from the grounds of the North American Tin Mining Company, State of Durango, Mexico. The company own a tract of land comprising upwards of seven hundred square miles, which is everywhere intersected with rivers and gulches, and along the banks of which are innumerable veins of tin ore, varying from two to seven feet in thickness, and containing ore which often assays as high as 75 per cent. of tin. The streams nearly all contain greater or less quantities of oxide of tin, usually in the form known as kidney ore, from its resemblance in color and shape to that organ. This ore is supposed to be formed in the mine, by aggregation, on the same principle that carbonates of copper are formed, by the decomposition of the sulphurets. We understand that it is the intention of the company, at an early day, to place a small portion of the stock in the market to raise a working fund for opening up the mines. It is said that the ore can be collected, and the metal run into crude bars and delivered at Mazatlan, for about $150 per ton; while the same is worth $400 per ton in Liverpool. The four large bars of metal are just as it is produced from the furnace; while the small bright bar is refined tin.

564 J. W. Reed, Simmons Spring, Camel County: A remarkable Petrifaction. [This is the same petrifaction to which allusion has been made under this number, where it appears in a previous page.]

This a very remarkable specimen of calcareous petrifaction. It is about the size of a man's clenched fist, and very much of such a shape. It was recently found by Mr. Reed, in Bear Creek. At the extreme front thereof are the distinct remains of what were thought to have been iron nails, about six or eight penny in size. The petrifaction was once evidently a hard, close grained piece of wood, and the question naturally asked, was, "Who drove those nails in that wood?"

Petrifaction itself is really but little understood. It is one of the secret, quiet operations of nature, that in the present state of human knowledge, can only be faintly explained. Its process is curious beyond parallel, and is of a nature similar to the physiological phenomena of the assimilation or conversion of nutriment into the fluid or solid substance of the animal body. It is universally conceded that the process of wood petrifaction is very slow; requiring ages for its consummation; yet authenticated cases of the total or partial petrifaction of the human body in a very short space of time, are quite common. Several occur to us as we write—one that of an elderly woman buried in Philadelphia in 1857. The grave was opened in May last, when her body was found completely petrified, and as perfect in form and appearance as when placed there, with the exception of the nose which, alone, was slightly decayed. It required the united strength of eight men to raise the body from the grave. When the grave was dug, a spring of water strongly impregnated with lime was struck, and flowed so freely that it was found necessary to bail it out before lowering the coffin. Hence the phenomena. The time which had elapsed had not been sufficient to at all affect the coffin. The body, however, from its more perishable nature, had yielded—as it is generally conceded that the tissue, whether wood or flesh, must decay to give place for the petrescent particles.

We have no doubt but that the petrifaction from Colusa, for such it really is, is of quite as ancient an origin as the numerous instances, and great masses of petrified wood so often found in nearly every portion of our mines. What appears to be nails is nothing but a deposition of iron, in the form of elongated crystals of sulphurets of iron. A close examination would appear to settle that matter beyond a doubt. We often hear of petrifactions being formed in a few weeks, or even days, in some springs of a peculiar mineral character containing large quantities of lime in solution. These petrifactions, however, are merely incrustations. The stoney matter having been newly formed over and around the wood, inclosing the same, as it were, in a closed case; but not displacing the woody fibre, as is done in a true petrifaction. Fleshy matter, under certain favorable circumstances, as in the instance above cited, may be petrified in a very short period of time, from the fact of its early decay, allowing a rapid displacement of its particles, and its entire conversion into calcareous matter, the only character which such rapid petrifactions assume.

— W. B. Warren & Co., San Francisco: samples of Lustrina, for polishing Metals, and the Mineral from which it is made; also, specimens of Silver Ore from the De Soto Mine.

The mineral from which this polishing powder is made, is said to be found in great abundance, but we are not advised of its locality. The manufactured article is very useful for polishing and cleaning metals and glass.

—

We notice among the minerals not numbered, or but recently entered, a fine large specimen of gold and silver ore, from the Social Company's lode, Eagan Canon, Reese River. If Reese River has been late in making her appearance at the Pavilion, or fails to show a large number of samples of her mineral, she has now made ample amends in this mammoth specimen from one of her rich mines. It will weigh several hundred pounds, and has every appearance of being very rich, showing free gold upon the surface, and any amount of decomposed sulphurets, apparently rich in that metal, to say nothing of the amount of silver which it may contain.

We also notice a box of ore from the Planet Mine, William's Fork, Arizona. This is a copper ore, and, judging from its appearance, we should think it might contain a notable per centage of silver. The Planet is well known as a rich and promising mine.

Nahl Brothers & Dickman.—The gentlemen comprising this firm have long ranked among the most celebrated of our artists, in oil, crayon and photography. Their display of pictures in the art gallery of the Pavilion bears testimony to the superior character of their work.

[From the Daily Fair Press, Monday, Sept. 4th.]

THE EFFECT PRODUCED.

So far in the history of the Industrial Fairs given by the Mechanics' Institute, the best of good feeling has existed between the managers and the public at large. The former have succeeded in discharging their delicate and responsible duties so as to give general satisfaction. If there has been any disappointment or growling among exhibitors, it was no more than might have been expected. The public have not only been satisfied, but delighted. Their patronage has been magnanimous and continuous. In fact they were so well pleased that they have, in numerous instances, expressed a hope that the Mechanics' Institute would go forward and erect a capacious and permanent edifice for the holding of annual Fairs hereafter.

We heartily indorse this suggestion. Such a structure is demanded by the growing wants of the country. We have hosts of inventors who are yearly adding to the improvements and simplifications of machinery. It is desirable they should have some point of rendezvous; some place in which to exhibit the works of their genius; where they might receive material benefits in the way of affording and acquiring instruction. A man of quick perceptive faculties not unfrequently obtains a hint from a mere glance at some new principle in mechanics, which lends to the enrichment of this branch of science. In addition, the public at large receive pleasure and benefit from visiting such exhibitions; and it is their voice which now demands the erection of a substantial pavilion for the uses of the Institute, where goods may be placed and kept, if it is thought proper, without disturbance or removal. A department devoted especially to the display of minerals, is greatly demanded; and in it, with properly directed effort, might be placed such a collection as would astonish the savans of the world.

The mechanics of this city have excellent credit. If their funds are short they can purchase a lot and erect a building upon it, by executing a mortgage against the same, and pledging the proceeds of their Fairs for a certain number of years, to secure payment. We hope they will give this matter consideration; and if the suggestion is practicable, proceed at once upon it. They will have the good wishes and co-operation of the people to sustain them in their enterprise.

Something New and Interesting.—When the lover of a cup of good coffee sees the grains from which it is distilled put into a hopper and turned out in form ready for use, he is capable of judging whether he has been drinking coffee, rye, or chichory. At the Metropolitan Steam Coffee and Spice Mills of Messrs. Sterlitz & Co., 25 Second street, he can, if he thinks proper, witness the whole process of grinding, both by steam and man power, and satisfy himself that no imposition is practiced upon him. They grind at these mills nothing but coffee; and rest their reputation upon the character of the article as represented. If coffee drinkers wish to procure an article pure and unadulterated, they must call at these mills to obtain it.

The Latest Entry.—Last, though not least among the entries at the Pavilion, is some sample specimens of "Brown's Metallic Weather Strips and Window Bands," a much needed article now being introduced into this city, and employed to keep the dust from shaky windows and doors, which are almost inseparable from this dry climate. These strips also prevent the unpleasant rattling of windows, keeping out the wet as well as the cold and dust. The invention is highly spoken of by all who have used it. O. W. Easton is the Agent for its sale on the Pacific coast. The samples at the Pavilion may be seen among the articles connected with the Mining and Scientific Press exhibition.

Receipts of the Fourth Week.—The receipts of the Fair last week were as follows: On Monday, $611; Tuesday, $525; Wednesday, $724.80; Thursday, $769.75; Friday, $928.60.

Receipts.—The receipts of the Fair, including Saturday evening, amount to $26,189.50.

To Correspondents.—We have received, from an attentive correspondent, "J. R. M." a full description of the mines and mill of the Confidence Mining Company, of Reese River. This communication should have appeared last week; but the demand on our columns by the Exhibition of the Mechanics' Institute, compels us to leave it over even another week. We trust our correspondent will bear with us in our emergency. We have also been compelled to lay over quite a number of other communications from different correspondents, for the same reason; all of which will receive attention at the earliest moment. We shall also re-commence our usual "Mining Summary" with next week's issue, and shall make it a point to pay especial attention hereafter to this important feature of the Press, and one in which so many of our readers are personally interested.

From Humboldt.—We have just seen a letter in the hand of Prof. Rowlandson, dated Napa, Sept. 7th, from parties interested in the Allen and Sutter oil well, on Mattole creek. The letter is in acknowledgement of the receipt of several small packages of oil refined by the Professor from the crude article from the above named well, expressing much gratification at the superior quality of the same, etc.; also refering to a rumor, uppareutly well authenticated, that this company has developed a flowing well. If this report is not strictly correct, we presume it is simply premature, as from developments already fully established, there can now be but very little doubt, that oil will soon be found there in such abundance as to render it of great importance.

Arizona Consolidated Mining Company.—Several changes of importance have recently transpired in the management of the above named company. At the meeting of its Trustees, on the 26th of August, Mr. James S. Spann, was appointed Superintendent of the Company's mine in Eureka District, Arizona Territory. With an ample credit, and a well selected bill of provisions, he has already started for the mines, and is sanguine of being able soon to ship paying quantities of rich, argentiferous galena ore, similar in quality to the fine 650 pound specimen exhibited at the Industrial Fair of the Mechanics' Institute. At a subsequent meeting, held September 5th, the office of the Company was removed from No. 6 Montgomery Block, to the office of Dr. E. F. Bunnell, No. 611 Clay street, where stockholders and others interested may obtain further information from Mr. George W. Bunnell, the present Secretary of the company.

The Institute Medal.—The Executive Committee of the Mechanics' Fair have had a gold medal prepared, to be awarded to that invention, manufacture, representative article or articles of utility, which shall be adjudged, by a committee of award, duly selected, worthy to receive it. The merits of the particular object or article must be considered *paramount.*

The medal is about the size of a Mexican silver dollar, and is set in a wreath of gold leaves, delicately chased, intermixed with pearls. The wreath is surmounted with a gold band tied into a bow-knot. The medal is sustained in the wreath by axles or pivots, and revolves at pleasure. It is a very beautiful production of art. It was manufactured by Mr. Mitchell, the maker of the splendid San Francisco made gold watch on exhibition, and weighs—wreath included—about two ounces. The obverse side contains the words, "Progress, genius, invention." The reverse is inscribed, "Awarded to," etc., etc. This fine medal may be seen in a show-case as the visitor to the Pavilion enters the door of the right hand art gallery.

Close of the Fair.—To-day is the twenty-seventh day of the Exhibition, and we expect the Fair will close to-night with a full house. We have endeavored to furnish a full report of the display, and shall next week resume our usual variety of reading.

From the Daily Fair Press, Friday, September 9.

Portland Boiler Works.—We have frequently mentioned the fact, through the columns of the Press, that we had no branch of mechanical industry that more richly deserves the fostering patronage and admiration of our people than the heavy work performed by our mechanics in iron. The building of high and low-pressure boilers, which are capable of passing the scrutiny and hydraulic tests of the Inspector, is something to be proud of, in a city yet in its swaddling clothes. And yet this triumph is one of our boasts. Moynihan & Aitken, of the Portland Boiler Works, on Mission street, can exhibit workmanship in this line which will force admiration. Success to our mechanics! It is they who make a people great, as education makes them free. Hence they are united in accomplishing a common object, for skill in labor demands mind; while education merely expands and enlightens.

The Tooth Ache.—The intensity of the pain accompanying this human malady is illustrated in the anecdote told of the German farmer. He was making a journey on horseback, when he beard cries of pain proceeding from a voice among the bushes by the roadside. He dismounted and proceeded to the spot to ascertain the cause. "What ish te matter," he inquired of the unfortunate victim of a severe accident. "O, help, help!" exclaimed the injured man; "I have fallen from a tree and had my leg broken." "Ish tat all!" replied the farmer, very philosophic lly, "I thought you had ze toothach!" No doubt toothache is one of our most painful of afflictions; but Dr. Belle has an apparatus on exhibition at the pavilion which "knocks" it. His system is to *freeze it out!* that is to say, he chills the gum, silences the ache, and jerks out the tooth without causing pain to the subject operated upon.

Undertaking.—The honors of burial are greatly esteemed, not only among civilized, but also barbarous nations. The Chinese are an example of a people who religiously observe the custom, and in some of the minute features of their burial rites, are not even surpassed by the Christianized nations. If these varlets have so nice a perception of what is due to the dead, how much keener should be our appreciation of the duties involved in the solemn rite. According to our faith, the corruptible becomes incorruptible, and he who departs from us, merely "lies down to pleasant dreams." Let the dead therefore be decently composed, and consigned to the tomb with all proper respect. To accomplish this laudable purpose, call on Atkins Massey, undertaker, 651 Sacramento street.

Merchants' Mutual Marine Insurance Company.—We would impress upon the minds of commercial readers the importance of patronizing this home insurance organization. The gentlemen who compose its officers are every way worthy of confidence, and in more ways than one are identified with your interests and those of your patrons throughout the coast. Our San Francisco merchants should not only patronize this company but go still further and recommend it to their neighbors.

The Institute Medal.—The committee selected to make the award of the Institute medal, which we have already described, is composed as follows: Gov. Low, Mayor Coon, Mayor Swift, of Sacramento, the President of the State Agricultural Society, the President of the San Joaquin District Agricultural Society, James Otis, Wm. Eckfeldt, and Gen. Halleck. The presentation of the medal is to be made to the fortunate winner, at the Pavilion, to-morrow evening.

Ruben's Wife.—It is to be hoped the Executive Committee are not going to forget "Ruben's Wife." Poor thing, she has suffered the disgrace of being a rejected picture, and had to be concealed in the Clerk's office, all on account of the scant nature of her apparel. This was no fault of hers, but of the artist, whose palate must have been deficient in paints at the time of finishing up his picture. Her husband, the Amsterdamian, occupies a conspicuous place in the Art Gallery, while she is disgraced. Such conduct is cruel. The chaste and lovely Helena Fermont did not deserve such treatment. Think of it—to be represented in a semi-nude condition, and dressed in skins at that, in the beginning of the sixteenth century, long after Griseldis and Ingomar had run their race, and puff-wigs were growing into fashion! The anachronism might be forgiven, but the brutality of the thing, never!

[OFFICIAL LIST.]

COMMITTEES OF AWARD

OF THE FIFTH INDUSTRIAL EXHIBITION.

Steam Machinery—C C Bemis, Thos J Winship, Henry S Smith.
Gears Machinery—J A Hobart, Wm H Scoville, John Roch.
Pumps and Hydraulics—I M Scott, Samuel Dinsmore, P Hesse.
Hats, Caps, and Furs—Thomas Yonng, J K White, J C Meussdorffer.
Men's and Boys's Clothing, and Woolen Goods—James Scrimgeour, C W Eanuge, John C Mitchell.
Furnishing Goods, etc—R O Atkins, Lewis Leland, H B Platt.
Cloaks, Dress-making, Millinery and Fancy Goods—Mrs M J Burke, Mrs. Thomas Young, Mrs H L Davis.
Embroidery, Fancy Needle Work, Fringes, Tassels, Chenille Work, Ladies' Dress Trimmings, etc.—Mrs C Vincent, Mrs Dunderburg, Mrs J O Williams.
Furniture and Cabinet Work—J Wigmore, John Bryant, W E Reed.
Upholstery—J O Eldridge, Samul J Fletcher, Chas Volburg.
Billiard Tables—Chester Brown, R N Van Brunt, J K Fitch.
Boots and Shoes—John Douglas, A D Campbell, T J Brodderick.
Trunks, Leather, Hose and Harness—Reuben Morton, David Scannell, Charles H Mead, John Fitzpatrick, D C McGillivray.
Cider Mills, Presses, Washing Machines, Brooms, Cooperage, etc.—Wm Gunn, Addison Martin, Wm H Hooper, C F Jones, David Pomeroy.
Agricultural Implements, Wheelbarrows, Hay Presses, Hay Cutters, Feed Boxes—E J Moore, Abner Doble, J A Hobart.
Brass, Lead, Wire Rope, Screws, Wire Work and Saws—J C Ayres, C H Robbins, E J Phelps.
Guns, Pistols, Fly Traps Fishing Tackle and Sporting Materials—Wm H Brown, gunsmith, John Orr, Lewis Coley, E W Leonard, Warren Loud.
Oil, Bleach and Stained Glass, Lumber, House and Boat Models Marble Mantels, Plaster Ornaments, Carpenter's Tools, Show Cases, Doors and Door Springs, Newell Posts, Scroll Sawing, Inlaid Work and Cordage—P J O'Connor, D Farquharson, E Roach, Joseph Ringer, W Boole.
Stoves and Ranges, Iron Pipe, Chimney Tops, Ventilators—J de la Montanya, J Bryan, Isaac Hyde
Cutlery and Surgical Instruments—Dr Holman, Lewis Leland, A W Rear, W Weichhart, Henry Wheeler.
Carriages, Buggies, and Vehicles of all Descriptions—J W Farren, J L Dignon, R S Eells, E W Byington Wm Ware.
Oil Paintings, Engraving, and Lithography—P Mezzara, F Vassault, — Koch, T A Barry, R J Van Dewater.
Architectural and Mechanical Drawings—E Farquharson, T J O'Connor, M F Butler, J M Scott, Joseph Monroe.
Penmanship—Dwight Bard, A G Doolittle, R N Van Brunt, Prof Knowlton, James Denman.
Gold Pens—R N Van Brunt, A J Doolittle, Dwight Bard.
Sculpture and Marble-work—F Arriola, O Gori, F A Butman, V Squarza, W Jewett
Wax and Fancy Work—Prof Miel, P Mezzara, F A Bulman
Musical Instruments—Geo T Evans, E Mezio, Prof Clark, Geo Kappitz, J W J Pierson, James Kendall, Geo Petitpos.
Sign Painting, Graining and Polishing—C Hopps, Thomas H Fletcher, Geo D Wyman.
Wines, Cordials and Bitters—S P Christy, J J Harkness, Jas Irwin.
Liquors, Ale, Beer and Cider—F C Belden, Philip Roach, P J O'Connor, Geo Hughes, G J Byrne.
Agricultural and Horticultural Products—J A Hobart, E J Ewell, C W Ilsin.
Floral Productions—Dr Thos Bennett, Mrs Joseph Rinpot, Mrs F E Harding.
Botany, Seeds, etc.—Dr Lanszweert, Theodore Baggo, S Adams.
Soaps, Oils, Candles, Yeast Powders, Lard, Extracts, Essential Oils, Spices, Mustards, Circassian Bloom, Eye Water, Hair Preservative, Concentrated Milk—Dr Lanszweert, Thomas Price, Royal Fisk,
Coffee, Bacon, Ham, Sugar, Vermicelli and Maccaroni—Thos Rowlandson Gardner S Hall, W Fisk Hitchcock.
Confectionary—Mrs G W Conkling, Mrs McComb, Mrs W E Loomis.
Matches—Geo S Dickey, M G Elmore, Samuel Perkins.
Minerals, Ores, Crystals, Paints, etc.—Prof G W Mims, H C Bennett, and Prof Nunan
Paper, Book Binding and Printing—Frank Eastman, A J Curtis, Wm Allen.
Silk, Cotton and Tobacco Culture—E Van Reed, H F Williams, and S Tyler.
Dentistry and Dental Chairs—Dr J B Beers, Dr Payne, Dr Galen Burdell, Dr David Burbank, and James Devoe.
Watch and Astronomical Instruments—James Anderson, W H Knowlton, and B B Horton.
Album Stereoscopes— — Snow, — Bennett, and Wm Bansman.
Coppersmiths' Work and Electrotyping—James Macken, O B Oakley, and W H S Clark.
Gilt Frames and Mirrors—John Brewster, W A Kohlmeyer, and E S Spear.
Miscellaneous Articles—C H Harrison, P J O'Connor, H W Bradley, C F Jones, and A S Hallidie.
Grain Separators—G G Beattie, R W Brown, and Lewis T Compton.
Inventions and Compounds—Dr. I. Rowell, Dr. Beverly R Cole, and Wm H Keith.

Insurance Agents.—Mrs. Hemans expressed a beautiful thought, when she wrote that—

"Leaves have their time to fall,
And flowers to wither at the north-winds' breath,
And stars to set—but all,
Thou hast all seasons for thine own, oh Death!"

No man has a moment's lease upon life, nor is any man's property—personal or real—secure from the accidents and incidents of daily occurrence. It therefore becomes an object for he who wishes to secure himself against the contingency of loss—perhaps ruin—to insure. If he designs engaging in a hazardous enterprise, where his life is in danger, by insuring that life, he secures a support for his family. In seasons of conflagration, insurance enables him to realize from his destroyed property. It is well, then, in both cases, to be on the safe side. Bigelow & Brother, are prepared to issue policies on liberal terms. The companies they represent possess a capital amounting to over *nineteen* millions of dollars! These gentlemen have occupied a promiuent position among our most reliable insurance agents for many years, are very active and substantial men, fully identified with the interests of California and the Pacific Coast. We are informed that they have paid losses during the past year of over $250,000, promptly in every case. Their office will be found at the N. W. corner of Sacramento and Montgomery streets.

Candy Moulds.—The Dellwig Brothers, confectioners and bakers, Fourth and Mission streets, have placed on exhibition in the Scientific Press collection of minerals and curiosities, a couple of wooden moulds, of German origin, made,—one in 1750, (which is, consequently, 115 years old,) and the other in 1781, which is 84 years old. The moulds are carved to represent two females, apparently queens, on two sides, and two kings on the reverse sides. They are venerable relics, and worthy to be seen.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, September 2.

4 shs Gould & Curry at 1135 per foot.
376 shs Daney at 42½@45½ per share.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, September 9th, 1865.

The condition of the money market is substantially unchanged. Continued ease nnd nbundnnce prevails, and first-class collateral can be readily placed at 1½ ℘ cent. per month in bank. Other descriptions of security are taken nt 1½ ℘ cent. per month. In the open market, transactions nre made within a range of 1@2 ℘ cent.

Receipts nf treasure from the interinr have been light since Saturday last, and amounted in the aggregate to less than $900,000. Bullion is meeting with a fair degree of inquiry from dealers and others, and gold bars are selling at 840@850. Silver bars have nlso improved slightly, and may be quoted at ¼ ℘ cent. premium to 1 ℘ cent. discount.

Legal Tender Notes nre in rather less request, nnd some $50,000 were dealt in at the Board, declining from 73⅛c to 72⅞c, nnd closing at 72¼c bid, 72⅜c nsked. Our latest telegraphic advices from the East quote gold at 145 on the 7th inst.

Dullness nnd depression have been characteristic features o the mining share market during the week, but at the close, some little animation is observable. Transactions at the Board have been inconsiderable, nnd mainly confined to a few leading stocks, most of which are now lower than on Saturday last.

Gould & Curry is in better favor, rising from $1,135 to $1,300 then selling at $1,310, nnd closing at $1,275 bid, $1,300 asked. The product of this mine in ore exceeded 5,000 tons lnst month, a portion of which was reserved for future reduction. It has been the intention of the company, for some time past, to accumulate a lnrge reserve of ore and materinl, so that there might be no interruption to active operations at the mill during the winter months. An early resumption of dividends is anticipated.

Alpha lns met with no sale this week, but is stronger, at $1,920 bid, $2,000 asked. A recent clean-up at the company's new mill realized some $16,000, being the product of nbout 350 tons of ore. An average of 80 tons of ore are now daily hoisted to the surface from the different levels.

Yellow Jacket opened at $1,430, receded to $1,420, rose to $1,475, fell to $1,450, rallied to $1,460, then sold at $1,440, and was dealt in yesterday nt $1,445@1,450. During the week ending August 27th, 1,479 tons of ore were extracted from the mine, and 963 tons were worked, yielding $28,717. The total receipts of bullion for the month of August amounted to $167,508.62, and the entire indebtedness of the company on the 1st inst. was $321,554.48, as against $340,000 on the 5th of the previous month. Some extraordinary disbursements were made last month for improvements in the south shaft and to the Morgan mill, amounting in all to $16,795; otherwise the debt would have been more considerably reduced. The Princess shaft and machinery are now in working order, and a station has been opened in the 430-feet level. In the air-shaft drift from this point a pay lode 28 feet wide has been disclosed.

Savnge is in rather less request, and 23 feet were sold, declining from $1,300 to $1,220, and closing at $1,240 bid. Receipts of bullion from this mine for the past month nmounted to some $80,000, and the present indebtedness of the company exceeds $145,000. The west body of ore, as met with in the first, second nnd third levels, continues to improve, nnd the lower level is also thnught to promise well.

Crown Point was dealt in to the extent of 50 feet, receding from $1,175 to $1,115, rallying to $1,140, dropping to $1,110, and selling yesterday nt $1,100@1,121. Both of the company's mills nre now running up to their full capacity upon ore taken from the upper levels. Nothing reported this week from the lower drift.

Belcher has been nctive, and wns steadily maintained, within a range of $870@922½, closing at $915 bid.

Hale & Norcross has revived a little, and some 35 feet changed hands, advancing from $480 to $540, and selling yesterday at $540@537. It is said that more flattering indications have been found this week. An assessment of $50 per foot was levied on the 5th inst., making in all thus far $725 per foot.

Ophir has obtained more favor, steadily rising from $280 to $340, and selling at the close at $360. Some 50 feet were sold at these rates. Shipment of bullion was received this week amounting to $19,000, and a promising body of ore is reported to have been found in the old works.

Chollar fell from $475 to $437½, and sold yesterday at $442½ @450, some 50 feet in all changing hands. Potosi has been more active, and 100 feet were dealt in, declining from $440 to $400, and closing at $412½@415. Receipts of bullion from these two claims during the month of August amounted to some $60,000, being the product of about 1,500 tons of ore.

Empire Mill and Mining Company fell from $390 to $380, at which rates 25 shares were sold. There will be no dividend for the month of August.

Imperial continues one of the strongest stocks on the list, and some 600 shares were dealt in, advancing from $252 to $262, and selling yesterday at $265@267½. The receipts of bullion from the Gold Hill and Rock Point mills, during the past month, exceeded $136,000. After a recent disbursement of some $30,000 for winter supplies, and the payment of a dividend to-day of $10 per share, a large surplus will remain in the treasury of the company. A reserve of some 1,500 tons of ore bas also been accumulated, and it is proposed to increase this amount very considerably. The reduction capacity of the two mills will be increased to 2,700 tons this month. The lower drift, now 150 feet distant from the shaft, is still in good ore.

Uncle Sam is in less request, and declining from $190 to $160 per shnre, rallying to $166, and selling yesterday at $168@170. Confidence fell from $130 to $121, and closes at $121 bid. Bullion met with a serious decline, dropping from $160 to $130, rising to $137, and selling yesterday at $132@135.

Daney rose from $42 to $53, steadily declined to $25, and changed hnnds at the close at $39@40 Sierra Nevada hns been largely dealt in, within a range of $18@20, closing at $21. Wide West was sold at $8@8¼; Kentuck at $75, aud North American at $24.

The total recorded sales of stocks and Legal Tender Notes since Saturday last amounted to $664,635.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For references, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, Sept. 9, 1865.

[From the DAILY FAIR PRESS.]

THE IRON INTEREST OF SAN FRANCISCO.

NUMBER ONE—MINERS' FOUNDRY.

The future importance of the iron interest of San Francisco can scarcely be estimated at the present time. When our railroads shall have penetrated into the mountains, and reached, with their lateral arms, all the important mineral resources of our vast interior and placed our facilities of locomotion and transportation on an equality with other parts of the world, we shall then be able to set at utter nought all attempts at competition in the heavy line of this business, and draw into San Francisco, as a common center, the entire iron business of the Pacific Coast, on both its eastern and western shores, as well as the thousands of islands with which its bosom is everywhere dotted. This, it will be borne in mind, is entirely additional to the almost incalculable amount of iron manufacture which must be required to work the illimitable extent of our mines of the precious and useful metals. These reflections were forced upon us yesterday, while passing through the extensive works of the Miners' Foundry, on First Street, and reviewing the large amount of heavy material which that establishment is just finishing up, on orders from the Sandwich Islands. Even that little cluster of islets is already becoming an important customer to the machine shops and foundries of this city. There are already not less than *thirty* large mills, with their heavy rollers and costly steam engines, at work on those islands, which number is rapidly increasing. The machinery for these mills has heretofore generally been obtained from Scotland, a small portion, only, from the Eastern States. Latterly, however, the sugar-planters of these islands have learned that they can obtain their machinery from this city about as cheap as from the East or from Europe, while a great saving is made in the matter of time—an important consideration in this fast age.

A most gratifying evidence of the new course which this business is now taking may be seen at the Miners' Foundry. This firm is now completing one heavy set of sugar rolls, twenty-six inches in diameter, and forty-two feet long, with heavy intermediate gearing, for the plantation of T. Metcalf, Esq., of Honolulu. Each roll, with shaft and pinion, weighs three and a half tons. They are designed for a first-class sugar mill, and are made extra heavy. This is the second mill furnished for the Islands from this city.

They are also finishing up an 8-foot vacuum pan, for the Honolulu Sugar Refinery. The casting of these pans is a very nice piece of work, and is done in loam or dry sand, in order to secure a greater degree of perfection. This pan, which has been made to take the place of the one now in use there, weighs about 10,000 pounds. The establishment for which it has been ordered is the only Sugar Refinery at the Islands, and which has been established to supply the home market with refined sugars.

The Miners' Foundry is also making a large tubular boiler for the Islands, sixty-six inches in diameter by fifteen feet long; also, two steam sugar clarifiers.

A large amount of quartz machinery is also in course of completion at this foundry, among which we noticed a mill for a Reese River Company, the engine of which has a 16-inch cylinder, with a 36-inch stroke; a 10-stamp mill for dry crushing, arranged so that the pulverized ore is taken from the mortars by fans and conveyed thus to bins, thence by cars to the top of the roasting furnaces, where it is readily emptied upon the hearth, and thence to a set of the Wheeler & Randall tractory pans, built up with wooden sides—the amalgamation being affected in 6-foot separators especially arranged to work in connection with those pans.—They have also under way two other 10-stamp mills, for Reese River, and one for Idaho, with a peculiar arrangement for roasting and grinding, now for the first time about to be introduced on this coast, and which we shall soon describe in full. This foundry has recently turned out an order of half a dozen of Hepburn & Peterson's pans, on an order from Washoe. The fine pan of this class on exhibition at the Pavilion was from this foundry.

NUMBER TWO—UNION IRON WORKS.

In continuing our articles on the Iron and Foundry Interest of San Francisco, we cannot omit giving a prominent position to the new enterprise of locomotive building, just initiated by H. J. Booth & Co., of the Union Iron Works, of this city; a business which in a very few years must become one of mammoth proportions. The people of California are deeply indebted to this firm for the enterprise exhibited by them for taking the initiatory in the same, which has been carried out at the cost of a large outlay over and above any present remuneration, and at the risk of a possible failure to successfully compete with the experienced skill and cheap labor of the East. The result of the enterprise has been the most complete mechanical triumph ever witnessed on the Pacific coast; as was abundantly proven to the numerous party of mechanics, engineers, and invited guests who went out to the Twin-Tree Station on the trial trip on Wednesday of last week. The performance, on that occasion, of the "California," the first regular locomotive ever constructed on the Pacific coast, was a triumph in which, not only the enterprising firm which built it, but all Californians as well, may take a just pride. The work of the engine was faultless, and its speed was demonstrated to be equal to that of any locomotive of its class ever constructed. It was tested on this trip to as high a rate as was safe for the accompanying train with its gay load, which was dashed along the rail, in one portion of the trip, at the rate of *sixty-seven miles an hour*, as timed by two different watches. What the engine would do, if driven to her utmost capacity, is left to conjecture alone. In its construction, no effort has been spared to bring together, and to combine into a perfect whole, all the improvements which have been introduced into locomotive building in the East; and it is the universal opinion of the best railroad engineers and mechanics who have examined this machine, that, for its class, its equal has not been built. Booth & Co. have three other locomotives of the same pattern, now drawing near to completion, each of which will possess all the excellencies combined in the California.

Some idea may be formed of the magnitude which the business of locomotive building must soon assume in this city, from the statement of Ex-Governor Stanford, made in his speech at the collation on the occasion of the trial trip alluded to, that at least *two hundred locomotives* would be required on the California railroads within the next five years. It is but fair to suppose that after the present triumph of our California mechanics in this direction, no further orders for either locomotives or railroad cars will be sent abroad; and we shall be much disappointed in our calculations if Booth & Co. do not, from this time forth, make locomotives a speciality, and thus fairly engraft upon California this new and important industry. Mr. Stanford, in alluding to the rapid progress of the railroad interest in this State, further remarked that—

So rapid had been the progress of the Pacific Central Road that the same would be completed to Colfax by September 1st, at which point an elevation of 2,600 feet above the level of the sea would be attained. By January 1st, 1866, Dutch Flat, an elevation of 3,700 feet would be reached, the greatest grade being 105 feet to the mile. Thence to the summit of the Sierras is a distance of thirty-four miles, on which portion of the route work would be pushed rapidly. At this station the track would be not less than six thousand nine hundred feet above the level of the Pacific Ocean. One tunnel, fifteen hundred feet in length, would have to be cut through the Summit Ridge. From the top of the Sierras to the valley below, the road could be constructed with comparative ease, and at little cost. Four thousand laborers were now at work, and by the first of October, five thousand would be in the employment of the Company. Other statistics were given which we have not space to advert to more fully.

In closing this article, as we have already extracted liberally from the speech of one gentleman on the occasion of the late excursion, we do not know that we can do any better than to give the remarks of Mr. I. M. Scott, on the same occasion. Mr. Scott is a member of the firm of H. J. Booth & Co., and the gentleman under whose more especial and immediate supervision this mechanical triumph has been constructed, and in whose brains it first assumed its full and complete form and proportions as we see it to day, and each day crossing along the iron rail between this city and San Jose. Mr. Scott said:

Ladies and Gentlemen:—Before referring to the honors which Mr. Doyle has seen fit to place upon my shoulders, allow me to continue the line of his last argument in favor of the San Jose Railroad. He tells us that the great Pacific Railroad is of no consequence unless it brings trade and travel to this road; that no railroad is of any consequence to us which does not double the business of the San Jose Railroad. We ask, of what use is the San Jose Railroad, unless it brings us locomotives to build? Of what use is the Central Pacific Railroad, or any other road, if we do not build the engines, and the State of California, and especially the City of San Francisco, does not derive some benefit from it? I ask these questions because I feel a deep interest in the future welfare of this coast, and have a strong faith in the final accomplishment of the grandest of all enterprises, the binding of all the States by this strong iron band, reaching from the Pacific to the Atlantic. We feel that our valleys and hills will never yield their treasures until the channels of trade run deep and free over the land! Many think railroads are monopolies, for the benefit of the few. They are a blessing to the many, and are closely connected with our social prosperity. The building of these engines will cause about ninety thousand dollars to change hands. Money collected by the railroad companies from the people of the State, paid by them to us for engines, and by us paid on for materials and labor, finds its way back to the people from whence it came, while the State and the people gain a railroad by the circulation, and the prosperity of the country is increased.

And now, ladies and gentlemen, though I have seen every rivet and bolt, every piece of material, and every hour of labor on that engine, there are others who deserve a share of the praise. To Mr. W. R. Eckart, our chief draughtsman, all praise is due for the skill and patience with which he worked out the tedious details of the engine, and, I am proud to say, not a single error occurred in his work; to the foremen of the different shops, a just share of credit is due for the faithful manner they performed their work; to the *Bishop* of the San Jose Railroad, who brought a ripe judgment gathered from twenty years of railroad experience, and contributed all the practical knowledge he possessed to the successful accomplishment of this enterprise—to him is due the ease of her motions and much of the success of the engine. Many thanks to the representative men of the Sacramento Valley Railroad and the Pacific Central Railroad, who contributed their mite to the general fund, and insured its early and complete success.

The interest shown by all classes in this engine, the road to San Jose, the grading of the Western Pacific, the fifty five miles of finished road on the Central Pacific, are facts that prove we are in earnest, and the great work of a great people will soon be completed.

NUMBER THREE—PACIFIC FOUNDRY.

The growing necessities of our commercial steam marine, which is fast spreading itself up and down the vast extent of our sea coast, is calling into active exercise the mechanical skill and inventive genius of our people to the end that we may be placed on an independent footing in this as well as in other branches of mechanical necessities. Our machine shops at first attempted only light work of this kind. As our ship-builders proved the feasibility and economy of constructing a heavy class of steamers, old machinery and engines built at the East, and which had survived their more perishable hulls, was at first taken out, refitted and placed within new hulls. Now, however, our builders are adopting the wiser policy of putting new machinery into their new boats, and having their engines and boilers made here, of a size and character more properly calculated for their work. Our machinists and foundrymen have also proved their ability to turn out such work of any desired capacity, and at prices which, considering the time saved, and other advantages gained, have fully proven the policy of having such work done here instead of sending to the Atlantic States for it.

Among those of our foundries which are making this class of work a speciality, we may mention Messrs. Goddard & Co., of the Pacific Iron Works. This establishment is now about finishing up a 10-foot propeller wheel—the largest ever built on this coast. This propeller is for the new steamer now building at North Point, for Messrs. Griffith & Johnson, and not yet named; but which is intended for a tug boat, that will be nearly double the power of any other in the harbor. They are also putting engines and boilers into the stern-wheel steamer, now nearly ready to launch from the foot of Third street; the machinery for which is already on board, but not yet completed.—This machinery is to be a duplicate of that of the Mount Eaton, which was also built by them, and which has been running about a year up the Encinal, to a place called Mount Eaton.

This foundry also built the machinery of the steamer Del Norte, and more recently overhauled that of the J. T. Wright, now in the North Pacific Ocean in the service of the Russian Telegraph Company. The repairs for the Ben. Holliday steamer line is also done by this firm. They also do all the Government repairs which are not sent to Mare Island. The recent overhauling of the Shubrick was done by them. They do such of the repairing for the Pacific Mail Steamship Co. as is not sent to the company's shops at Benicia. We trust the time will soon come when this important steamship company will find it to its advantage to build as well as repair its boats here. There is no question but that our mechanics will soon excel as much in building first-class ocean steamships as they now do in those of a lesser capacity. The opening trade with China and Japan, and the increasing coast business, will, ere long, create a demand for a large addition to our present fleet of first-class ocean steamers; and we trust the coming man may soon be found with ability and energy sufficient to satisfy our capitalists that there is no necessity for building these steamers 20,000 miles distant from the place where they are needed for service. Whenever that man appears who will undertake the building of those steamers here, he will find the mechanics all ready, and educated fully up to the high mark for supplying them with the required motive power.

The engines of the propeller Reliance, placed upon the Alviso route some three months since, were built by Goddard & Co., and have done most satisfactory service since. The machinery of the new boat placed in the Petaluma trade, some two or three weeks since, was from their shops. In addition to their marine work, they are also just completing a large 80-horse power engine for the Baltimore American mining company, of Virginia City, to drive a set of heavy hoisting drums, and a deep 10-inch pump. They have just completed an order for ten of Varney's Pans, large numbers of which they are constantly turning out for various parts of the mines, in addition to a great quantity of miscellaneous work, for almost every conceivable purpose, and for all parts of the Pacific coast, and the interior.

While passing through their works, we noticed a new 8 foot lathe, twenty-five feet in length, which they have recently received, together with a pair 36-inches in diameter and twenty feet long—the three forming a very important addition to their stock of machine tools.

NUMBER FOUR—VULCAN IRON WORKS.

In continuing our articles on the iron interests of San Francisco, we come now to the Vulcan Iron Works, which are located at Nos. 137 and 139 First street. The proprietors of this establishment are Richard Ivers, Samuel Aitken, Charles R. Steiger and N. D. Aruot—the last member of the firm having bought the interest of the late Paul Tornet. There are at present 145 men employed in the various departments, manufacturing new, and repairing old machinery. Owing to the length of time this company has been in business, and the particular care and attention paid to this latter branch of their business, the Vulcan Iron Works have a large force constantly on repair

work. They have at present, in hand and just completed, the following work for the Yellow Jacket Mining Company: A large engine, 22-inch cylinder and 4 feet stroke, to be employed in driving their mill, when the dry season stops the water. With the exception of the Gould & Curry beam engine (also built by the V. I. W. Co.,) this will be the largest engine in Nevada. This company are also re-modeling the hoisting works of the Gould & Curry, from the present plan of friction wheels to that of direct drums and flat wire rope. This plan of hoisting was introduced by this firm, and has proved to be the best and most satisfactory in use.

The Vulcan Iron Works have been very successful in their machinery for working mines. From personal experience they were convinced of the superiority of the common system, employed in the extensive mining operations of Europe; and instead of being led away by the new and crude ideas of inexperienced miners, they have adopted and adhered to that kind of machinery which has been thoroughly proven, and which is best suited to the mine for which it is intended. The fact that machinery built by them for heavy pumping purposes in Grass Valley, as long ago as 1853 and '54, is still at work there, and performing as well as any built within the last two or three years, affords abundant proof of the superiority of the class of machinery which this firm has adopted for such purposes.

They have at present two large pumps and pumping apparatus for the Chollar and Potosi mine, the balance-bob for which is made of wrought iron, and is thirty feet long and fifteen feet high. This is a beautiful piece of wrought iron bracing, and can be seen standing in the middle of the erection shop—a model of strength, beauty and lightness. The overhead pulleys are eight feet in diameter.

The principal amalgamating machinery manufactured by this firm is the Hepburn & Peterson, and Baux & Gaiod pans, and the Heath grinder—all of which are represented in the fair. The Baux & Gaiod pan is, at present, amalgamating a lot of rock as a test against a mill in Tuolumne county. There is also a large amount of machinery for a sugar mill, consisting of pans, air pumps, etc., giving further evidence of this rising branch of industry supplied by Mexico and the Sandwich Islands.

This firm has also in course of construction a locomotive for the Napa Valley Railroad. This is the eighth locomotive engine built at this foundry, as follows: three for the Dalles railroad in Oregon, two for the Alameda railroad, two for the Oakland road, and the one now building for the Napa road. Although these locomotives are of a very light class—not being calculated for heavy work, like those turned out by a neighboring firm—they are, nevertheless, entitled to the designation of locomotives, and this firm considers itself fully entitled to the position of a pioneer in the important enterprise of locomotive building. The first of these machines was built under the direction of Mr. Spratt, on Pine street, and was designed by C. W. Stevens, of Oakland. These locomotives are something entirely different from any employed at the East, and have been designed especially for the light work of a class of our California railroads, upon which it would be impossible to drive the heavy machines used on the San Jose or Central Pacific roads. They are the result of the application of California genius to the especial wants of California.

This firm is doing quite an important business in the construction of the Jonval Turbines, some of which, built by them, and ran on the Carson river, have reached as high as 100-horse power, and are spoken of in the highest terms by those using them, as being cheaper in first cost, giving a better power, with less trouble in running them, than any hitherto employed by such parties.

Scattered around the works are parts of various jobs, amongst which are a large number of water pipes for Alcatraz Island, from 10 to 14 inches diameter; a number of car wheels; any quantity of shoes and dies of excellent hard white iron, and in fact something of almost everything pertaining to the iron trade of the Pacific coast.

NUMBER FIVE—FULTON FOUNDRY.

Among those who were early in the field of iron manufacture in this city, we may mention the Messrs. Hinckly & Co., of the Fulton Foundry. This establishment enjoys a high reputation, and has been a large source of profit to its founders and proprietors. Our city is adorned with large numbers of ornamental architectural castings from this foundry which, we believe, was the first to introduce that branch of business into this State. Their business embraces every department of mill machinery, steam engines, saw-mill castings, etc. If they have any specialty it is saw-mill machinery—as a large proportion of the saw-mills which have been put up on the Pacific coast have gone out from this foundry. They have just received an order for a saw-mill and engine to be put up at the town of Oakland, Oregon, near Jacksonville.

This firm has recently sent a pair of steamboat engines to Portland, for a new boat which is being built there; also an engine and boiler for a barrel stave factory at St. Johns, near Portland—the only establishment of this kind, we believe, on the northern coast. They recently filled an order for a large quartz mill, located near Rocky Bar, Alturas County, Idaho, in which are employed six of Moore's grinding pans; two more of these grinders were ordered yesterday, for the same place.

Moore's grinders are manufactured exclusively at this foundry; and though but recently introduced to the mining public, are coming rapidly into favor, on their merits alone. Those who have used them speak highly of their efficiency, while their simplicity admits of their first cost being placed at a very low figure. The quartz may be fed into these pans direct from any ordinary dry crusher; it not being necessary to crush finer than to the size of beans. By the use of these pans the employment of stamps and the consequent unavoidable loss of gold from the rush of water required by them is avoided. The pulp passes through the machine with a regular flow; the amalgamation being effected without triturating the quicksilver in immediate connection with the pulp.

Five mills have recently been sent to Colorado—two of them with engines—from this foundry, and each provided with a set of Moore's grinders. Two others were shipped a few days since to Powder River, Oregon, to be employed in the quartz mill of Col. J. S. Buckle's, President of the Oregon Steam Navigation Company. The general work turned out at this establishment comprises every variety of iron work known on this coast, and orders are being constantly received from all parts of the Pacific coast, the interior and the neighboring State of Mexico. They are prepared to turn out castings as high as six tons in weight, and steam engines from six to 175 horse power.

GANG SAWED LUMBER.—Carpenters and builders generally speak positively in favor of the gang sawed lumber which is now coming into this market from the mills using Hendy's new patent gang saws. The principal cause of this is the fact that the lumber is sawed true on every side, and perfectly even and uniform from end to end, no matter what may be its length. A gang was on exhibition last year, consisting of six saws. The lumber is held firmly in the stick until cut out each way in a single passage by the saws. This prevents the springing of the timber, and hence irregular sawing. A set of these saws will produce 30,000 feet of seantling, or 25,000 feet of inch boards in 12 hours. Samples of this lumber may be seen at the Pavilion.

STRONG'S AMALGAMATOR.—This is a new pan, invented by Mr. W. L. Stroug, and is now for the first time placed on exhibition. It has been in use for some time at the metallurgical works of Kimball & Murphy, the proprietors of which establishment speak in terms of high commendation of its merits as an effectual and rapid reducer. It works by little power, and produces a thorough agitation of the pulp. Mr. Strong is a studious and persevering worker, and well deserves the success his invention seems destined to receive.

A FRIGHT.—A couple of city belles, who were ignorant of the primitive styles adopted by the inmates of the New England Kitchen, were promenading arm in arm around the fountain of the pavilion on Tuesday evening, when one of Aunt Susan's recruits brushed past.

"Law, what a fright!" exclaimed one of the pretty ones, shrinking to avoid contact with the strange looking creature.

"She is crazy," suggested the other. "She is from a mad-house! Where's brother?" and the horrified darlings hurried off to find a protector, certain that without one they were likely at any moment to be swallowed by an anthropophagus.

(From the Daily Fair Press of Saturday, Sept. 2.)

CALIFORNIA HOMESTEAD ASSOCIATION.—We would call the attention of our readers to an advertisement in our columns of the California Homestead Association, which was formed two months since and has purchased blocks No. 540 and 541 of the western addition. The property lies within three blocks of the Turk street railroad, is nearly on the grade, and excellent water can be obtained at a short depth. The Post street railroad, which will soon be constructed, will run from Montgomery street through Post to Fillmore street, thence to Pine street and through Pine to Cemetery Avenue, passing directly by this property, which is bounded by Pine, Broderick, Sacramento and Baker streets, and lies on each side of California street, which is eighty-five feet wide. This railroad, when built, will greatly enhance the value of the ground. Several fine houses are now being erected near this property, and improvements are going on rapidly in the immediate neighborhood of the same. The property has been purchased at a great bargain, and the lots, which are nearly all 27½ feet front by 137½ feet deep, will cost the members only $250, which they are to pay in twenty-five monthly installments of $10 each. The expenses of the Association will be very small, as its affairs are being managed in the most economical manner. The title is derived directly from Milo Hoadley, and is perfectly clear—there being no adverse claims. We understand that all the stock is taken but twelve or fifteen shares, which may be secured by calling at the office of J. S. Luty, Secretary, 305 Montgomery street, corner of Pine, rooms 2 and 6, where maps of the property, abstract of title, etc., can be seen, and explicit information obtained.

Homestead associations in this city have almost invariably proved very profitable investments, and, judging from the manner in which the affairs of the California Homestead Association are conducted, the location of their property, and the reasonable figure at which it has been purchased, we have reason to believe that its members will not only acquire desirable homestead lots in an easy manner, but that their property will rapidly increase in value, and they will thus have made a very profitable as well as a perfectly safe investment.

When the stockholders of the association have made six monthly payments, the property will be divided among them, in the usual manner, and each member will receive a contract for a deed to the lot or lots to which he will be entitled; thus, by paying the small sum of $60, a fine homestead lot is secured which may then be improved, and the payments of $10 per month to be made thereafter will not amount to much more than a lease of the lot for the same time would cost. The first regular annual meeting of the stockholders for the election of officers, to serve for one year, will be held on the 15th of October next.

VENERABLE RELICS.—Mrs. Kellog has submitted for our inspection a number of heirlooms preserved in her father's (the Barney) family, of a venerable character, and highly prized by those who possess them. They consist of a teacup and saucer, imported by Daniel Dorsey, of the Ellicott Mills, Maryland, in 1779; four spoons, manufactured from a quart silver tankard, of cotemporaneous date; a lot of patchwork, executed by three colored servants in the family of Daniel Dorsey, 1800; two pieces of chintz, imported from England by Daniel Dorsey in 1784, which cost $1.50 and $2 per yard, Continental money; a portrait of Eleanor Dorsey, wife of Daniel Dorsey, a lady who gave birth to sixteen children, two of seven of whom, now living, are upwards of eighty years old; and a table-cloth and one of sixteen napkins, imported by Daniel Dorsey, from England, to be expressly used on the occasion of his wedding, in 1779. The table-cloth was used at the weddings of a majority of his children. Mrs. Barney, a surviving daughter, has had it in possession nearly forty years. It has also been used at the weddings of most of her children. It passed safely through the great fire at Detroit, in 1847; a conflagration in Chicago, in 1850; through the great fire at Sacramento, in 1852, and the flood immediately following, and the fires and floods which afterwards, on several occasions, visited that city. It has been in use more or less for eighty-six years, and is still in an excellent state of preservation.

GENERAL STATIONERY.—J. Isaacs & Co., northwest corner of Merchant and Sansome streets, is a convenient and favorable place to procure the finest articles of general stationery, blank books, cutlery, and many other articles of a fancy and useful character.

THE INDUSTRIAL DRAWING ACADEMY.—In one of the art galleries, the visitor to the Pavilion of the Fair must not fail to observe four drawings, from the Industrial Drawing Academy, 408 Pine street, numbered respectively, 364 (a screw), 365 (a French father guarding his son on the retreat from Moscow), 366 (the new Jewish synagogue, of San Francisco), and No. — (two horses). To our mind they exhibit the very perfection of that order of genius. The numbskull ought never to attempt drawing, but the lad of quick parts and bright perceptive faculties should no more omit to make it a branch of study than he would reading or writing. It is not only an accomplishment, it is a utility. We had almost qualified the phrase by the adjective "indispensable." It is certainly the handmaid of mathematics. There is no mode by which the comprehension can so easily be reached as through the diagram. The man who, with his pencil, can elucidate an idea, embodies that idea, and gives it form and dimension. This is the especial object and office of a talent like that of drawing. The man or boy who possesses the talent can plan a house, devise a model, draw a landscape, shape a thought, preserve a recollection, sketch the features of a friend; in fact, enjoy the felicity of creating and propelling a world for himself, in which all the figures and characters of a lively fancy are shaped into form, and look only the breath of life to make them "good fellows, companionable and merry." The Industrial Drawing Academy is now in recess. It will open again Sept. 4th. The parent who has a son, or the guardian who has a ward old enough to learn drawing, ought by all means to have him taught the art among his earliest accomplishments; and if he has a taste for it, through the whole of his after life he will find himself vastly profited by the knowledge. Mr. A. Coulon, the author of some of the sketches in the gallery, is associated with Prof. Bello. His works speak for his ability, and require no further commendation.

CALIFORNIA KEROSENE.—California kerosene, distilled at the laboratory of E. Benoist, 643 Third street, may be seen burning, every evening, at the mineral department of the MINING AND SCIENTIFIC PRESS, at the Pavilion. This burning fluid was distilled from crude petroleum obtained from the Lexington well, Santa Cruz county.

PROTECTION AGAINST FIRE.—The Executive Committee have made ample arrangements for protection against fire in the Pavilion. A hose carriage is kept constantly at the foot of the stairs of the north gallery, and Captain De Groot placed in charge of the same by the Chief Engineer of the Fire Department.

PATENT PAPER REEL FOR TELEGRAPH REGISTER.—This new and valuable invention consists of two reels, one to supply the register with paper and the other to receive it. The receiver is worked by a small cord running from a spindle attached to the reel, through a pulley fastened to the ceiling above with a half pound weight. The spindle is made to work on either reel, so the reels can be shifted without trouble. The inventor, Mr. L. W. Worth, of Sonoma, Cal., claims that they are superior to other reels, as they are simple, cheap, and can be put up by a boy in a few minutes ready for use; they can be placed on a table or shelf without fastening so as to be moved wherever wanted, at any time. They are light and easy to adjust. The paper can be kept clean and straight and run through the register from sixteen to eighteen times with ease. He has also a reel put together in two parts to put a roll of register paper on without winding. It is spoken of in high terms of satisfaction by telegraph operators in this city, and is now being used at the State Line Telegraph Office. Application has been made for letters patent through our agency.

IN our notice of the pump challenges in yesterday's issue, we omitted to state that the terms of Mr. Hansbrow's challenge were to pump by the power of one or two men. He thinks that omission in our item calculated to give the reader a wrong impression, and therefore we make this statement.

[From the Daily Fair Press of Wednesday, Sept. 6.]

THE INFLAMABILITY OF COAL OILS.

Among the entries to-day, is an instrument, exhibited by Dewey & Co., of the MINING AND SCIENTIFIC PRESS, for testing the inflamability of coal oils. This instrument was recently patented by Mr. John Tagliabue, of New York, and obtained a premium offered by the American Institute of that city. The importance of some reliable means of demonstrating *by a perfectly certain and reliable test*, the presence of explosive material in petroleum oil, is a desideratum that must at once commend it to the notice of all persons interested in the trade and production of this now universal article of merchandise, and every-day household use. It is believed that this is the only instrument yet devised which has attained the end desired. The defects of the various devices hitherto employed, are such as admit of the indication of the explosive point at fifteen or twenty degrees below what the oil will stand, or the exact reverse—thus leaving a margin of from thirty to forty degrees, which is a degree of uncertainty not at all admissible in practice. It is claimed that this instrument will determine definitely, and to the very degree, the precise point which any oil submitted to its test will bear before explosion can take place. A full description of the construction and mode of using the machine, seems to render this fact apparent to any person who will take the pains to thoroughly examine into its practical operation.

INGENIOUS RAT TRAP.—Of all the rodent family, excepting, perhaps, the beaver, the rat exhibits the most cunning. He may be caught in a steel trap once, perhaps twice, but the third time rarely, if ever. He will pass over it time and again without nibbling at its bait, or even treading on any portion of it which will fly the spring. But the rat is not infallible among quadrupeds. He may be captured by the use of deep laid strategy, such as we think has been attained in an invention now on exhibition at the Fair Pavilion, by Mr. A. Badlam, of Sacramento. It is a wire cage, about thirty inches in length, with three compartments. In the two first are platforms, worked by a combination of wires reaching across the top of the cage, and operating after the manner of a walking beam. When the trap is set, the further or inner end of the first platform is lifted up by the arm of the walking beam. The rat enters for the bait, which is suspended from the top of the cage. As he advances towards it he treads on the raised end of the platform, which goes down with his weight, closing the door behind him with a slight clash, and opening a second door at his nose, through which he escapes to avoid the noise in his rear. He treads on the raised end of a second platform, which goes down with his weight precisely as in the first instance, closing the second door against his retreat, but raising the first door, which is the mode of again setting the trap. The noise of the closing of the second door causes the rat to spring through a third door, which is the old fashioned wire gate, hung in an oblique position with its hinges above. This gate is raised by the nose and back of the rat in working its entrance to the third compartment, and falls when the rat has got through, cutting off its retreat hopelessly.

TO BE WELL DRESSED.—The times are considered unusually hard. A great many persons are out of employment, seeking for something to do. This class, of all others, ought to go well dressed. So ought the man of wealth who has no position. Let those deny it who may, it is a fact, nevertheless, that dress produces its effect upon many minds; to prejudice them against a man who is shabbily clad, and cause them to treat with respect and obsequious consideration one who is clothed in broadcloths. J. R. Mead & Co., corner of Washington and Sansome streets, are prepared to furnish elegant outfits, which will entitle the wearer to recognition in the highest circles, where his talents frequently entitle him to go, but where he is refused admission because he is not genteely dressed.

BOOK BINDING.—Bartling & Kimball turn out work in the line of book binding which will compare favorably with the finest workmanship of the East. They took a premium last year at the Fair, and deserve another this year for the ability and skill with which they perform their work. Their place of business is at 505 Clay street, same entrance and No. as the MINING and SCIENTIFIC PRESS office.

[From the DAILY FAIR PRESS, Thursday, Sept. 7.]

THE INEBRIATE.—Of all the vices with which humanity is afflicted, intemperance is perhaps the most common and pernicious. It not only drags honorable men down from lofty and profitable position, but frequently blasts the hopes of families and reduces them to beggary. Notwithstanding the serious consequences entailed by the vice, it should perhaps be regarded with more charity than any or all other human afflictions. It is not always bad men who contract it, nor is it peculiarly the offspring of depraved hearts. On the contrary, the most generous and noble of natures are imperceptibly ensnared in its toils. No man ever patronized the cup with the intention of becoming a drunkard. It would be an insult to press such an accusation. The appetite for strong drink is formed by degrees, and without malice. Whilst denouncing its evil influences, the moralist himself falls a victim to its temptations. For these reasons, it becomes no man, while gazing upon the fallen victim of intemperance, to say, "Avaunt!" or "I am purer than thee," for no man can tell how soon he may himself become an object of equal commisseration.

We indulge these remarks, in view of the fact, that the proceeds of the Fair to-morrow evening are to be given to the "Home of the Inebriate," and to express the hope that it may be largely and generously patronized.

DRYTOWN MARBLE LEAD.—One of the latest but highly important entries at the Mechanics' Fair, is a sample of California marble, from the above named ledge. The quarry is located on Dry Creek, Amador county, about halfway between Drytown and Fiddletown, which is about thirty miles nearer to steam communication than the famous Indian Diggings marble works. The piece on exhibition shows susceptibility to a good polish. Its highly crystalized nature adapts the stone to outside use, and being highly variegated, it cannot but recommend itself to favorable notice for house fronts. A steam mill has been erected at the works, with the modern appliances for manufacturing, and we hope our builders will take into consideration the superior texture and appearance of this material, and give it immediate trial. It ought soon to become popular in our rapidly growing city, which is sadly deficient in such fine material at anything like a reasonable price. We are assured that the proprietors, Messrs. Myers & Richtmyer, are active and reliable gentlemen, well and favorably known in Amador county, and we hope they will meet with that encouragement by our citizens which their important enterprise entitles them to.

TWO MORE NIGHTS.—The Fair lasts but two more nights. Hundreds of citizens who have derived pleasure from visiting the Pavilion will regret this. It has become a place of fashionable resort—as much so as the theater—and certainly affords more instruction to the observing and ambitious mind. The flashing of the fountains, the music of the band, the flashing of bright eyes, the presence of pretty faces, and the study of interesting objects, will all come to an end on Saturday night! *Sic transit gloria mundi!*

THE CABINET.—Before the Fair closes we would direct the attention of every one who visits the pavilion to the splendid collection of minerals, under the superintendence of Capt. Aiken. Years may elapse before another opportunity is offered to behold so extensive and elaborately classified a cabinet. Scientific men are particularly requested to examine these minerals. This fine collection is exhibited under the immediate auspices of the MINING AND SCIENTIFIC PRESS, presented by contributors to the Fifth Industrial Exhibition of the Mechanics' Institute. We take pride in making the statement, in the conviction that, in all its features as a mineral show, it has never been surpassed on this coast, if, indeed, in any country of the world.

THE LICK HOUSE.—This already large and beautiful hotel, is receiving the improvement of an additional building, which will enable it greatly to extend its lodging facilities to patrons. Under the joint proprietorship of Messrs. Alstrom & Johnson, it has acquired a popularity second to no public house in California. As a place for families it has been preferred. At the present time an extensive feature of its patronage is derived from this source. Its apartments are all of a superior kind. Sojourners and boarders are entertained with every kindness and hospitality; and for these reasons the house has become a great favorite with the public—a distinction which it merits from the able manner in which it is kept.

[From the DAILY FAIR PRESS.]

"HISTORY VINDICATES ITSELF."

In the whole range of poetry there is no expression more correct than that the "eternal years" belong to truth. It will vindicate itself wherever the conscience has been educated, and the mind is willing to admit the teachings of morality. Detraction may for a while hold it in abeyance, misrepresentation cover it with a cloud, malice prevent it from circulation, envy conceal it from view—yet, in the end, its hour of culmination is sure to arrive, and the horizon where it shines to be made irradiant with its glory.

The proprietors of the Grover & Baker Sewing Machine contend that the combined efforts of detraction, misrepresentation, malice, and envy, have for years past been directed against their invention, but that it has, like the heaven-born principle which we have used for illustration, survived all opposition, and to-day stands higher in public estimation than at any previous hour in its history.

This machine was amongst the earliest to attain public celebrity. Wherever it was introduced it gave satisfaction, and was abundantly capable, from the wide range of work it performed, to meet all the demands of sewing practised in a christianized country. Its success then became a matter of jealousy, and soon the market was crowded with machines which, with the obtrusive impudence of Banquo's ghost, sought to crowd annointed loyalty from its seat. This the inventor and proprietors could quietly have borne. They could even have rejoiced at the success which attended the honorable business enterprise of cotemporaries. It was not rivalry that was feared, nor the good fortune of their opponents that was regretted. There was room for ten thousand inventions, so long as the public mind was left unbiased in its choice as between them. The Grover & Baker Company complain only that the capabilities of their machine have been underrated and falsified; that it has been denied the fame it has acquired over its competitors by the superiority of its achievements, and that its work has been claimed as the performance of other machines, which, without the ability to compete with it in a fair field, are nevertheless anxious to appropriate or destroy its reputation.

One of the most elegant pieces of embroidery ever executed by a needle in the hands of a skillful sewer, was worked on the Grover & Baker machine last fall, in the shape of an opera cloak, by Mrs. P. E. Rodgers (now Mrs. Harding), and presented to the lady of Gov. Low. It produced astonishment wherever exhibited, on account of the elegant superiority of its workmanship. The same lady has since manufactured a second cloak, which was designed for presentation to Mrs. Lincoln, and was about to be sent forward to that lady when news of the assassination of the President was received. It was then retained, and can now be seen in the Pavilion of the Fair, on exhibition with other splendid specimens of embroidery, which speak their own praise, the praise of the lady who worked them, and of the machine on which they were manufactured, better than we could describe them.

It has been asserted, and wickedly maintained, by the enemies of the Grover & Baker machine, that it was incapable of performing such work, and that the opera cloak now exhibited as a triumph of its abilities, was *imported!* This, it must be confessed, is a high compliment to the machine, and to Mrs. Harding, who performed the work, although it was by no means so intended. It is an admission of *superiority* for the machine, and that is all its proprietors have ever claimed for it.

However, what has once been done can be done again. Those who are willing to make the denial in person—that this opera cloak was made *entire* upon the Grover & Baker machine, have only to present sufficient inducement for another trial of its capabilities, when Mrs. Harding will pledge herself to produce a specimen of embroidery and appliqued work which shall *even surpass that now on exhibition!*

It has been further said, that the proprietors complain, that *only* an experienced and skillful operator on the machine, like Mrs Harding, can turn out such work. There are hundreds of ladies residing in California who can give a flat contradiction to this assertion. *Any* lady accustomed to the use of a machine can produce work equally as fine. Specimens of embroidery are shown which were manufactured by mere tyros in the use of the machine, almost, if not quite, equal in merit to that performed on this cloak.

The proprietors of the Grover & Baker sewing machine claim that while it is adapted to all kinds of work ordinarily done in a family, it is also susceptible of executing the *very finest work capable of being performed by the needle.*

While exhibiting this machine at the London International Exhibition of 1862, Mrs. Harding obtained a medal for the superior plain and ornamental work which she executed on it. She embroidered a dressing gown and smoking cap, which were presented to the Prince of Wales. Illustrations of the cap and gown appeared in the London *News*, with an article, of which the following is an extract:

The gown, as seen by our engraving, is of blue silk of Spitalfields manufacture, specially made for that purpose; the richest in color and quality that could possibly be procured. The facings, cuffs, collar, and pockets, are of white satin, and the whole of the inside lining, back, and sleeves, even the pockets, are of the finest white satin. The inside of the lining is covered with stitching of the most elaborate character that can be conceived. The design is a combination of the rose, thistle, and shamrock, beautifully intertwined and combined with a considerable variety of other flowers. The whole of this work is done in white, producing a remarkable chaste effect. The facings, on the contrary, are stitched in blue, and this beautifully softens the otherwise striking contrast between the blue silk and the white satin. Round the whole of the work a graceful box-wreath forms as it were an endless band—this like the other parts of the work being the finest of stiching. The edges of the robe and of its fringes are all richly corded with a blue and white braided cord so manufactured as to give the white the appearance of pearls. The cap is made of the same material and lined in a similar manner; on the inside of the band a vine wreath twines itself round, whilst in the center of the crown the Prince of Wales' plume, with the motto "*Ich Dien*," appears exquisitely stitched and in a more graceful form than met the eye anywhere during the recent illuminations. The outside of the band and the outside of the crown are beautifully braided in white, the braid being made and stitched on it at the same moment and by the same machine which executed all the fine sewing and plain and ornamental quilting which cover these beautiful garments. It goes as a tribute of American loyalty from the manufacturers, Messrs. Newton Wilson & Co., the eminent sewing-machinists, of 144 High Holborn. We understand it is chiefly the work of a Californian lady, Mrs. Rogers, who is their principal artiste; and it is a splendid specimen of sewing-machine work.

The proprietors of this machine invite a rigid investigation and comparison of its merits. They are willing to base their claims to superiority upon the certificates of those working men and women who have tried it and are competent to judge of its capabilities. They rely upon what it *has* done for what it *can* do. No finer sewing or embroidery was ever executed than this machine has performed in the hands of those who understand how to operate it, and the process of its operation is so simple, that a child of ten years of age can understand it after less than a week's instruction.

LONDON AND SAN FRANCISCO BANK.—This institution, with Hon. Milton S. Latham as its business manager, assisted by Camilo Martin, is now regularly under way and doing a prosperous business. It deals in bills of exchange and letters of credit upon London, Paris, Hamburg, Hongkong, New York City, and all the principal cities of the world.

KELLUM & WINTER.—Among the oldest and best of our dental firms, is that of the gentlemen whose names form the caption of this article. The terms upon which they operate have always been inviting, and the work they perform such as to secure them a steady continuance of patronage.

THE MACHINERY DEPARTMENT AT THE FAIR. When the whole exhibition has proved a real triumph through the successful management of the various committees, it is not our purpose or disposition to speak of one portion of the display to the disparagement of another, yet being cognizant of some of the many annoyances and difficulties naturally encountered in the charge of the machinery department, one cannot refrain from heartily congratulating its principal superintendent, Mr. W. W. Hanscom, upon his good success. Everything throughout seems thoroughly arranged, and in good running order, and we pass throughout the whole division without hearing a murmur of complaint against the management by the numerous exhibitors, whose interests are supposed to be more or less conflicting with one another. The immense growl given recently by one of our daily papers, which no doubt the perpetrators expected would shake things considerably about the Pavilion, apparently came us far from getting up the desired disaffection, among the exhibitors, as it was distant from truth in its foundation. Notwithstanding the machinery department is more extensive this year than last, we are assured there is no lack of steam or propelling power. We have spoken more plainly about this department from the fact that it has not hitherto received the full meed of praise which is justly due the display and its management.

AT a general meeting of the Germania Mt. Diablo Coal Mining Company, held on the 14th day of August, 1865, the following officers were chosen. Trustees: J. G. Anderson, J. C. Junge, C. G. Landis, Elkan Wasserman; President, H. Plunger; Treasuror, E. Engelberg; Secretary, E. J. Pfeiffer. Office 210 Post street, near Dupont.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News dealers, acting as our agents, will receive liberal commissions.

☞ BOUND VOLUMES FOR SALE. ☜

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)	$5.00
Six Months, (one volume)	3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

A Baggage Master will be sent through each trip.

Cabin passengers will be berthed for Atlantic steamer.

OLIVER ELDRIDGE, Agent.

Corner Sacramento and Leidesdorff sts.

A SPICY COMPLIMENT.—A correspondent of the Sacramento *Union* gives the following notice of one of our fair contributors who has combined utility with beauty in her work:

Decidedly the prettiest thing on exhibition in the Fair is an afghan, worked by Miss Addie Meacham, a young lady only twelve years old, as I learn from the columns of the *Call*. The question arises in one's mind as we look at this wonder of embroidery: If the young lady does this at twelve, what will she do at eighteen, and what miracle of needlework may we not expect her to accomplish at twenty-four? For twelve is not the noon of life, however it may indicate meridian on the dial plates which look down on us from the church towers. Crowds gather around this afghan, visiting and revisiting it, finding it impossible to pass it, and still returning to its vicinity as though each rose of its composition had a special magnet spell. There is only one thing which surprises me about the work—not the name of JOHN PAUL, but some other man's, is embroidered in the corner. This is of course a mistake which will be remedied when the exhibition is over—the intention being to mislead people as to whom the gift is really intended for. I wish I knew the young lady, so that when she threatened to give me a piece of her mind for speaking thus freely about her in print, I could reply that I should prefer a piece of her worsted. I do not know, though, after all, but that I'd prefer to wait and have a piece embroidered for me when the artist had reached the age of eighteen, for of course it would be just fifty per cent. better than the present one, done at twelve. But long before that time, it is likely that the whole work of her needle will be selfishly claimed by some individual who will have taken her for better or worsted, and will refuse to permit the exquisite talent for embroidery, of which we here have a specimen, to be exercised for the benefit of others.

THE BESSEMER PROCESS.—The growing application of the Bessemer system to the production of steel, with the much larger attention that is being paid now than has been paid for some time past in the application of steel to uses before assigned to iron, is occasioning a growing demand in South Staffordshire. Mr. Clayton, at Westbromwich, is now erecting eighteen furnaces at the works of the Dowlais Company, twenty-four at the Barrow Steel Works, is making castings for six at Ebbw Vale, is on with the third lot for Messrs John Brown & Co., Sheffield, and after putting up twenty-two for Messrs. Cammill & Co., at the Cyclops Works, in the town, is now putting up six for the Yorkshire Steel and Ironworks of the same firm at Penistone. The same maker, is also putting up furnaces at the Lancanshire Steel Works, Gorton Lane, and at the Gibraltar Works, Newton Heath. These furnaces are all for smelting iron to make steel or for the heating of ingots of steel.—*London Engineer*.

Our Patent Agency.
The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the so-called "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
S. P. KIMBALL, J. R. MURPHY.
10v10

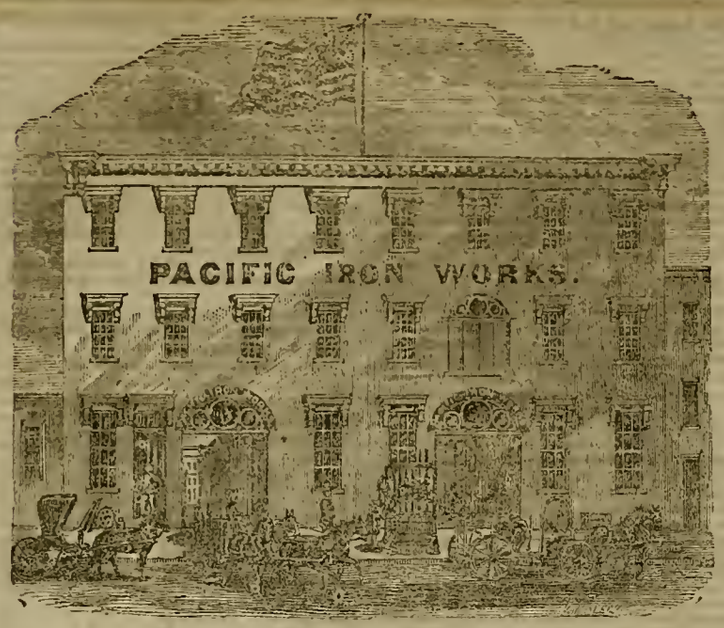
☞ All Jobs promptly attended to. Prices moderate.☜
No. 125 First street, opposite Minna next door to Pacific Foundry. 3vlf
[Removed from Oregon street, between Front and Davis.]

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.



THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Buttery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

Machinists and Foundries.
H. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.
UNION IRON WORKS!
Corner First and Mission streets,
SAN FRANCISCO.
ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery; Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.
Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.
Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.
Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Ventelli's tubs, Patera's concentrators, Walker's pans, Bees' pan, German barrels, Arastra Gearing, Chilie Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,
Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.
We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron.
All work done in the best manner at the lowest cash prices.
21vl0 **H. J. BOOTH & CO.**

MINERS' FOUNDRY
— AND —
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, free of cost.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.
HOWLAND, ANGEL & KING.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.
IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.
The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as
Mining, Steamship, and Steamboat Machinery,

Railroad Machinery,	Flouring Mills,
Locomotives,	Quartz Mills,
Car Trucks,	Sugar Mills,
Car Wheels,	Saw Mills,
Housings and Irons; and	

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

PORTLAND BOILER WORKS.
MOYNIHAN & AITKEN,
BOILER MAKERS AND SHEET IRON WORKERS.
N. B.—All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms.
Mission street, between Beale and Fremont streets, San Francisco. qy29-1

PHOTOGRAPHIC CHEMICALS.—The attention of photographic artists is called to the fine display of granulated and chrystalized nitrate of silver, which has recently been placed by Dr. Lanszweert, in a show case, in the MINING AND SCIENTIFIC PRESS Mineral Department. It is a matter of the greatest importance to the photographer, that he should be supplied with a pure article of nitrate of silver, and to this end Dr. L. has made this preparation a special study. He prepares and exhibits it both chrystalized and granular; in the latter form to avoid the necessity of handling the chrystals, to break them up, where small quantities only are wanted. These samples are a home product, made of California silver and fully equal, if not superior to the best that can be imported. The amount of this article required by the photographers on the Pacific Coast cannot be less than 400 pounds a month—a very important item when its value is taken into consideration.

In the same case with the above, we find samples of copper ores, copper hullion, and sulphate of copper, from Peavine Valley, Nevada, with diplomas awarded to Dr. Lanszweert by the managers of the Washoe Fair of 1863. The sulphite of copper was manufactured direct from the poor ores of that metal, without the use of "free sulphuric acid," and by a process of his own, which the Doctor has freely given to the world, and fully described in the MINING AND SCIENTIFIC PRESS of a recent date.

ABORIGINAL AND LABRADONIAN AUTOMATON TOYS.—In one of the show cases of our collection of minerals and curiosities, are several automaton toys of a very ludicrous character. Three of the figures are men, and three women, to represent members of the Digger Indian tribe, of Digger manufacture. Three others—a man, wife and baby, clad in skins—are from Labrador; and, like Cassio's wine, "'fore God, are better than 'tothers." The whole are funny enough, and will excite a smile on the countenance of whoever sees them.

HAZARD'S POWDER.—Every sportsman knows something about Hazard's duck and rifle powder. It is the most popular brand in the United States. Edward H. Parker is a large dealer in that article, including blasting powder and fuse. He also deals in shots of all sizes—specially Tatham's patent finish drop shot. Place of business, 224 California street. We recommend our friends, with a great deal of confidence, to Mr. Parker's establishment, whenever they wish a reliable article at a fair price.

THE population of California in 1831 was a little over twenty-three thousand; in the early part of 1849, twenty-six thousand; in 1850, one hundred and seventeen thousand; in 1852, two hundred and sixty-four thousand; in 1857, five hundred and thirty-eight thousand, and at this time is over six hundred thousand.

New Mining Advertisements.

Continued Mining Advertisements will be found on other pages.

Apollo Gold and Silver Mining Company, Lauder county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of September, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable on the 9th day of September, 1865, in United States gold and silver coin, to the Secretary, No. 402 Front street, San Francisco, Cal.

60	6½	George Work	4½

San Francisco, Sept. 8th, 1865.

E. J. DRINKHOUSE, Secretary.

Office, 228 Front street, San Francisco, Cal. se9 2w

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Segregated Belcher Mining Company, Gold Hill District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of September, 1865, an assessment of two dollars per share was levied upon the capital stock of said Company, payable on the 11th day of September, 1865, in United States gold and silver coin, to the Secretary, 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 7th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 23d day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, 410 Montgomery street, San Francisco. au26-3w

Wisconsin Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on September 17th (Sunday) changed to Monday, September 18th, 1865, at 10 A. M. of said day.

au12 4w J. WARREN CLARK, Secretary.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Amador and Alpine counties and the State of Nevada.

Thos. Poyzer, of Grass Valley, for Nevada, Yuba and Sierra counties.

THE IRON MANUFACTURE.—The Philadelphia *Press* says the iron interest continues to be depressed throughout Pennsylvania, and both rolling mills, etc., and collieries, are closing every week. Many give the choice to their workmen of accepting lower wages or having the works closed, and the workmen generally prefer the latter course. In view of the dull state of the business, the proprietors are rather benefited thereby.

THE English sparrows which have been introduced into Jersey have cleaned the trees entirely of the worms. A pair will destroy six hundred caterpillers daily in feeding their young. The robin of this country is equally as good a tree vermifuge, and ought not to be killed by sportsmen. They are now found in our public squares, doing the work of clearing the trees of vermin.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinklied.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-qy

OIL WELL BORING.

J. SEVENOAKS,

Contractor

For Well Boring and Erecting all kinds of Machinery connected therewith.

Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1529 San Francisco. 2v11

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity, "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

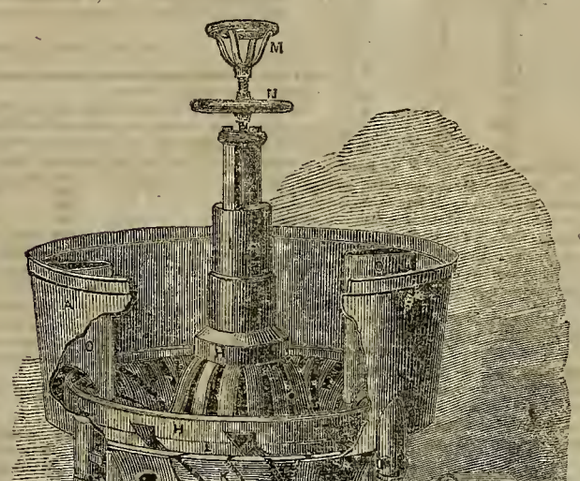
Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.



THE WHEELER & RANDALL Grinder and Amalgamator

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

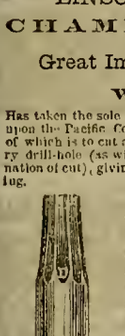
ATTENTION, MINERS!

LINSCOTT'S PATENT
CHAMBER DRILL.
Great Improving in Blasting.
W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.



D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¼ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water or Steam Power. For further information address W. W. HANSCOM.
1 Golden State Iron Works, San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of metal effected in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 9th, 1864.

HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

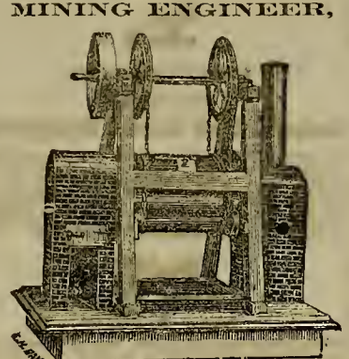
THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crescentic Quartz Crusher; his Pulverizer, and his Improved Prothero Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer.
21v9

W. BRUCKNER,
MINING ENGINEER,



Begs leave to call the attention of the mining public to his apparatus for ROASTING SULPHURETS, one of which is now being exhibited at the Mechanics' Fair. Parties wishing to test their ores by this roasting process are requested to leave their orders at the MECHANICS' FAIR DAILY PRESS office. 7df

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of
Quartz or Ores
To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,
Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
1v1 San Francisco.

VALUABLE
PATENT RIGHT
FOR SALE.

The patent right for the United States of a valuable invention can be secured at a bargain by applying at this office. The article is one of general application throughout civilization.

DEWEY & CO., Publishers.

THE HAMMER QUARTZ MILL.

PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.

Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.
21v10 RIX & LOGAN.

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

HUNT'S PATENT
Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,
1v10 28 Second street, San Francisco

Equal to the Best Overshot Wheel IN EXISTENCE.

POWER PLEDGED

LEFFEL'S
AMERICAN DOUBLE TURBINE.

The DOUBLE TURBINES, so long expected, have arrived at last, and orders can now be filled. We have a large supply of the different sizes, from 20 inches to 30¾. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

The above Wheel will be exhibited during the Fair of the Mechanics' Institute, where all may see it and hear its merits explained. This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 90 to 300 pounds will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS.
4v11-tf Care RICHARDS & MCCHOKEN, San Francisco.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

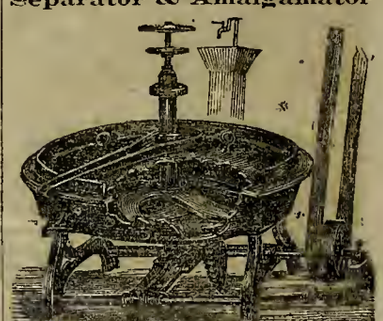
This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pans in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

MINING AND SCIENTIFIC PRESS
PATENT AGENCY.
For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 8, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Cavent is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against the subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we make a thorough investigation to be made into the reasons presented by the Examiner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a reissue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

COMBINED
FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Model on exhibition at foot of stairs in the Pavilion. Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

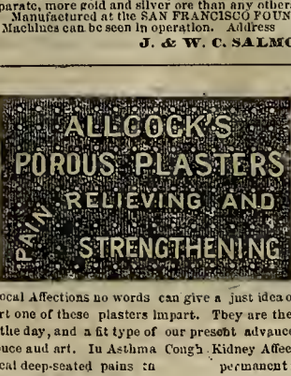
SALMON'S
PROPELLOR AMALGAMATOR
AND
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 J. & W. C. SALMON.



In Local Affections no words can give a just idea of the comfort one of these plasters impart. They are the plaster of the day, and a fit type of our present advancement in science and art. In Asthma Cough Kidney Affections, and local deep-seated pains it is a permanent relief. TRY ONE, and be convinced.

HELMBOLD'S
FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H
HELMBOLD'S
FLUID EXTRACT BUCHU
AND
Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *nauseous and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

E
USE HEMBOLD'S
FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu
IS THE GREAT DIURETIC.

L
HELMBOLD'S
HIGHLY CONCENTRATED
Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scrofula Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M
NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O
HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain; a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

IN THE PROBATE COURT, CITY AND COUNTY OF San Francisco, California. In the matter of the Estate of J. W. WILEY alias J. H. CHURCHILL, deceased. Notice to Creditors—All persons are hereby notified, who have claims against the said deceased, or this estate, to present the same, with necessary vouchers, to the undersigned, at No. 601 Merchant street, San Francisco, within four months after the first publication of this notice (a summary administration of this estate having been ordered), else the same will be forever barred.

J. A. WOODSON,
Attorney for P. WARNER, Admr of said Estate,
604 Merchant street.
San Francisco Aug. 26, 1866. 8v11-4w

COUNTY COURT, CITY AND COUNTY OF SAN FRANcisco.—In the matter of the application of the Palmyra Mill and Mining Company for an order of dissolution.

Notice is hereby given to all persons interested that the Palmyra Mill and Mining Company have this day filed their petition in the County Clerk's office of said City and County, praying for an order of dissolution, and in pursuance of an order of the Hon. Samuel Cowles, this day made, all persons interested are hereby notified to be and appear before the Hon. Samuel Cowles, County Judge of said city and county, at his chambers, in the City Hall, on MONDAY, the 2d day of October, 1865, at 9 o'clock, A. M., of that day, to show cause, if any they have, why the prayers of said petitioners should not be granted.

Witness my hand and seal of said Court, this 30th day of August, 1865.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Mining and Scientific Press.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS, And Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 16, 1865.

VOLUME XI. Number 11.

OUR NEW YORK AGENCY.

Mr. Geo. M. Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the Mining and Scientific Press at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "Stockholder," No. 72 William street.

OUR PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the Mining and Scientific Press can be accommodated by calling upon our Agent, Mr. Turner Hamilton, at the Assembly Building, 106 Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

Our Paper by Express.—Owing to the fact of Wells Fargo & Co requiring publishers to pay 2½ cents per copy in advance on papers sent to subscribers in the interior, we are obliged to make our subscription terms by express $6 50 per annum.

THE IRON AND FOUNDRY INTERESTS OF SAN FRANCISCO.

NUMBER SIX—GOLDEN STATE FOUNDRY.

One of the earliest of those who first began to foresee the future growth of the iron interests of San Francisco, was the founder of the Golden State Foundry, which institution is now conducted under the firm of Palmer, Knox & Co. Mr. Knox is the inventor and patentee of the celebrated Knox Amalgamating Pan, one of the earliest of these useful improvements introduced into the business of quartz mining, and the first of a class of machinery which has worked an entire and most important revolution in the business of gold and silver mining. These pans, in all their varied forms, are as yet peculiar to California; but must soon find their way into quartz mills and amalgamating rooms in all parts of the world.

The Golden State Foundry, at the present time, is largely engaged in preparing the iron work for the bridges for that portion of the Western Pacific Railroad which is now being graded between San Jose and Stockton. This iron work consists of tie rods, bolts, braces, angle and latteral blocks, etc., which enter into the construction of trestle-work bridges. In answering the demands for this work, this foundry has completely exhausted the market of certain sizes of wrought iron—both the stock now on hand, and all that which is to arrive for several months to come. These sizes are all the round iron embraced between that of five-eighths and two and one quarter inches in diameter. Some idea of the extent of this work may be inferred from the fact that one item in this construction embraces a section of the road five miles long, every rod of which has to be supported on trestle work!

Among the general work which has been finished up at this foundry, we may notice a 25-horse power engine and 10-stamp mill, with furnaces, barrels, etc., complete, for the Pioneer Mining Company, at Reese River; also an 8-stamp mill, with irons for a water wheel for a mill now being construeted near Placerville, a 15-horse power hoisting engine for a company in Volcano, and a lot of Wheeler & Randall pans and Knox's amalgamators. They are also completing the iron work for four sets of castings for Hogan's patent process for desulphurizing ores by the aid of super-heated steam—the same process which is now being worked across the bay in Oakland. Two sets of these castings go to Angel's Camp, in Tuolumne County, two to Drytown, Amador County, and two to Volcano, Amador. In addition to the above they are constantly engaged on a large amount of miscellaneous work, jobbing, repairing, etc.

The daily consumption of pig iron at this foundry is about four tons, and fifteen tons monthly of wrought iron. About forty men are kept constantly employed. The pattern room and general machinery of Golden State Foundry are as complete, although they may not be as extensive, as those of some of their more pretentious neighbors. This establishment forms an important feature in the great iron interest of this city, which has grown up so rapidly and from such small beginnings to a magnitude most astonishing to witness as the result of but little over a single decade of time.

At this foundry is also manufactured Hanscom's Crusher. Of the various jaw crushers, and rock breakers, on exhibition last year in the Pavilion, we find only this one returned for operation this year. It received the first premium in 1864. No simpler, cheaper, or more reliable crusher for breaking rock and reducing quartz, has yet, to our knowledge, been invented and gone through the test that this machine has stood during the past year. Mr. Henry S. Smith, foreman of this establishment, holds the patent right of this coast for the manufacture and sale of Dunbar's Patent Self-Adjusting Piston Packing, which is becoming exceedingly popular wherever introduced. Orders for this packing are fast increasing. The Tyler Water Wheel, one of the most reliable yet invented, is manufactured and sold at the Golden State Works.

—

In our previous report of some of the foundries in this series of articles, we omitted to mention some features which we give in the following appended remarks:

The large 22-inch cylinder engine just completed at the Vulcan Iron Works for the Yellow Jacket Mining Company, is fitted with the Meyer's cut-off valve motion, the only perfect cut-off yet applied to slide valve engines. It is perfectly self-adjusting, and can be put in or out of gear at a moment's notice. A cut off of this description can be seen in operation in the pumping engines of the San Francisco Water Works Co., where it has been running for some time with the best results, as regards economy and regularity. For the pumps mentioned as manufactured for the Chollar and Potosi mine, the Vulcan Iron Works Company have cast the largest spur wheel yet cast in the State, viz: 12 feet diameter, 14 inch face, 4 inch pitch, and weighing 12,500 pounds. The mould for this wheel was got up without a pattern, and with core-boxes only. The wheel, when cast, came out of the sand without a blemish.

Amongst the enterprises of this company, which we omitted to mention in our previous article, is the Howell Improved Rotary Crusher, which is yet destined to make its mark amongst quartz crushing machinery. The proprietors of this establishment have been convinced of the correctness of the principles governing the crushing power of this machine, and have spent time and money in bringing it to perfection. They now have one running at their works, pulverizing anything that is brought to it; and the quality of the work done is as near perfection as we can hope to attain, viz: seven eighths of the material will go through a screen of 10,000 to the inch. At present it is crushing oxyd of manganese, a material as much harder than quartz, as quartz is harder than marble. In connection with this mill, they have got up an engine, with a double piston and perfectly balanced, whereby a high velocity of piston is attained without any of that dangerous and racking motion that single piston engines have when run at a high speed. One of this style of engine has been running one line of shafting in the present Fair, and has been highly spoken of by all experts who have seen it. It is very light, and requires hardly any foundation—2,500 pounds engine being able to run 40-horse power, if run fast, and 28-horse power, if run same speed as the common engine. We have been lengthy in our notice of this, as it is just the thing needed for mountain machinery, in many cases saving nearly its own price in the item of freight.

Going Home.—We regret to announce that Dr. C. T. Jackson finds it necessary to take his departure homeward on the steamer of Monday next. The Doctor has spent several months in our midst, examining into the mineral resources of the Pacific coast, and making himself generally acquainted with the topography and varied commercial and agricultural interests of California. It gives us pleasure to state that he has formed a very favorable opinion of our resources, and that he will carry with him to the East, and also to Europe, where he will shortly visit, a high estimate of the future growth and importance of the Golden State. A large number of the friends of education met with the teachers and pupils in the main hall of the Lincoln school house, on Friday afternoon last, to listen to a lecture on geology, which be delivered on that occasion. The lecture was replete with information, and was presented in an easy and familiar manner most eminently calculated to interest and instruct the mixed audience before which he was called to speak. It is to be regretted that the Doctor cannot make it consistent with his other duties to prolong his stay among us. No scientific man has ever visited California, where observations will prove of so much value to us abroad, as will those of Dr. Jackson. His extensive experience and observation in the fields of science and among men of science in all parts of the world, have rendered his name and fame cosmopolitan, and will give weight to his opinion, wherever it may find expression. Californians may justly esteem it a fortunate circumstance that he has found his way hither; and we feel most fully assured that all with whom he has met during his stay here, will unite with us in wishing him a safe return to his home and friends, and many years of future happiness and prosperity.

Rush to Idaho and Montana.—The rush to Idaho and Montana continues unabated. A large part of the emigration goes up the Missouri river, which has been unusually high during the Summer. The land travel by this route is much less than across the plains.

Personal.—We have received a call from Messrs. Boult and Stetefeldt, who recently arrived in this city from New York, *en route* for Austin, Nevada, where they propose to establish themselves as assayers and mining engineers. In addition to the ordinary work of an assay office, they will also establish a chemical and analytical department, a branch of business in connection with mining which has heretofore been quite too much neglected on the Pacific coast. Simple assays of ores for one or two of their mineral constituents are very short of all that is needed. The intelligent amalgamator, before going to work upon his ores, should know each constituent part thereof—in no other way can he work understandingly. Analytical assays, only, should be the foundation for work in the amalgamating room; and especially is this required in operating upon the silver ores of Nevada, which comprise among their constituents almost everything in the whole range of metallurgical nomenclature. Our Reese River friends will doubtless find these gentlemen fully up to the proper standard in their intricate profession. Of this fact the undoubted references which they give from both European and American professors, will scarcely admit of a doubt. We would call attention to their card in another column.

Heavy Railroad Engineering.—The line of railroad projected from Vera Cruz to the city of Mexico contemplates some very heavy railroad engineering. The length of the road will be 280 miles. The summit will exact an elevation of 7,600 feet above the level of the sea. Before reaching that point, the grade, in forming across a valley descends 800 feet and, of course, has to ascend the same number of feet on the opposite side. The medium grade is 211 feet to the mile. The descent, (for it is after passing the summit going westward) is continuous for eight miles, making an elevation, on returning, in that distance of 1,688 feet! On the first two miles of this grade there are to be three stone viaducts, averaging 400 feet in length each, and 100 feet high; also, three tunnels about 200 feet each—both viaducts and tunnels to be on a grade of 211 feet per mile, and curvature of 400 feet radius. The line continues with the same grade and numerous curves of 400 feet radius, until it reaches the valley of the Great Mexican Highway, a distance of 18 miles, and total descent of 3,498 feet. From this point it has a gradual inclination until it reaches the Chickeevete Mountains, where it takes a shape almost questionable as to its feasibility. A valley has to be crossed by a viaduct 1,000 feet long and 300 feet high; also numerous tunnels, one of which is 1,600 feet long.

Westward, Ho!—Some idea of the immense immigration across the Plains the present year may be had by knowing that the records kept at Nebraska City of the number of teams that crossed the Platte at that point previous to the 1st of August, show that upwards of 13,500 vehicles have passed over, averaging five animals to a team; and at least as many human beings as animals have crossed. And still they come.

Mechanics' Fair Awards.—The Executive Committee were in session last evening reviewing the reports of the examining committees and completing the list of premiums, which we expect to be able to announce next week.

Descriptive Catalogue

—OF THE—

INDUSTRIAL EXHIBITION

Of the Mechanics' Institute, 1865.

Additional Entries.

[The following list comprises all the entries made at the Pavilion subsequent to the publication of our Catalogue in pamphlet form, up to 12 o'clock, M., September 8th.]

606 Robert Anderson, San Francisco: one Model of a man of war.

607 Macdonald Bros., San Francisco: superior sample of Back Boards for looking glasses, etc.

608 J. W. Whitaker, San Francisco: one Linen Handkerchief one hundred years old.

609 Pacific Anatomical Museum, San Francisco: one case of Eggs, showing different stages of incubation; one anatomical specimen of a Dissected Arm; one anatomical specimen of a Child.

610 J. Wise, San Francisco: three Oil Paintings; two Water Color Paintings.

611 Mrs. S. Mish, San Francisco: one case of Millinery Goods.

612 Miss Martha Comfort, San Francisco: one bouquet of Skeleton Leaves, in a California-made frame.

613 Larkins & Co., San Francisco: two Open Buggies; one Top Buggy.

614 Mr. S. Hill, San Francisco: one Sofa Cushion.

615 Rowland, Walker & Co., San Francisco: one box of White Sand, from David Jacks, Monterey.

616 Thomas Maher, South Watsonville, Santa Cruz county: one Convertible Gang Plow.

617 Wm. Hollis, San Francisco: one Stove-pipe Damper.

618 J. M. Moore, San Francisco: one painting of Autumn Leaves.

619 Wm. H. Keith & Co., San Francisco: one glass jar of Crude Petroleum, from Mattole.

620 Chas. Castles, San Francisco: one Oil Painting.

630 J. A. Bauer, San Francisco: three India Ink Drawings—Schiller, the Mokelumne river, and Faust and Marguerita.

631 George K. Porter, Santa Cruz: three bundles of Calf Skins.

632 Mrs. Flora S. Godfrey, San Francisco: one Antique Chair; one Fancy Table.

633 Wheeler Martin, San Francisco: three Paintings, in frames.

634 Miss Carrie Baldwin, San Francisco: one embroidered Sofa Cushion.

635 Moses Chinmark, San Francisco: one specimen Petrified Wood; one do. Blank Cartridge; one skin of an Albatross' Foot; one Chinese Pillow; one Fly Gun.

636 Hepburn & Peterson, San Francisco: one Amalgamating Pan.

637 T. H. Selby & Co., San Francisco: eight coils, three cones, three reels, and three pieces of Lead Pipe, and one package of Shot Lead, manufactured at their lead factory in this city.

639 Mrs. R. Velasco, San Francisco: three embroidered Handkerchiefs, and designed to imitate engravings.

640 Goodwin & Co., San Francisco: one Turkish Chair; one Side-board.

641 Swain & Brown, San Francisco, one case of Ornamental Cake and Confectionery.

642 Swain & Brown, San Francisco: one Marino Tree, from the Marquesas Islands; one bunch of Coral.

643 J. M. Aiken, Sonora: four pieces of Gold-bearing Quartz.

644 Adolph Muller, San Francisco: Set of Furs.

646 L. W. North, San Francisco: one Patent Paper Reel, for a telegraph machine—a California invention.

647 John Dougherty, San Francisco: one Soap Stone Sawmill; one Rock Crusher and Mill; one Pulverizing Mill.

648 O. W. Easton, San Francisco: three strips of Brown's Metallic Weather Strips.

649 Smith & Hauscom, San Francisco: one Tyler Water Wheel.

650 J. A. Bauer, San Francisco: six bottles of California Champagne.

651 Mrs. Bendar, San Francisco: one Washing Machine.

653 W. A. Howard, San Francisco: one Pebble Table.

654 H. Pierce, San Francisco: one Quartz Crusher.

655 A. Badlam, San Francisco: one Rat Trap.

656 Miss S. V. Greene, San Francisco: specimen of Wax Flowers.

658 George Hoyle, San Francisco: one Marble Frame; one Ornament.

659 Jones & McCormick, San Francisco: one Operating Model of Screw Paddle Wheel.

660 Dr. Lanszweert, San Francisco: samples of Photographic Granulated and Crystalized Nitrate of Silver.

661 Dr. Lanszweert, San Francisco: samples of Copper Ore, Bullion, and Sulphate of Copper, from Peavine Valley, Nevada.

662 Myers & Ritchmeyer, Drytown, Amador county: one block of Marble.

663 W. B. Frisbie & Co., San Francisco: one Canterberg & Vanpel Piano.

664 James M. Smith, San Francisco: two Coffee Roasting Machines.

665 Capt. J. M. Aiken, Sonora: one Cane and Case.

666 McPherson & Wetherbee, San Francisco: two redwood Boards 7 ft. 5 in. wide and 12 ft. long.

667 Mrs. Blake, San Francisco: seven pieces of Embroidery.

668 Mrs. Judge Pratt, San Francisco: one Feather Fan, in frame.

669 Curtis & Allen, San Francisco: two samples of Paper Flour Bags.

670 Jas. Irwin, San Francisco: one Liquor Case.

671 Dellwig & Bros., San Francisco: two Ancient Moulds, made in 1750 and 1781, to be used for candies or blanc mange, etc.

672 J. Pierce, San Francisco: set of Parlor Furniture, etc.

673 Jay Wheelock, San Francisco: one Animal Rat Trap, of a new construction, so contrived as that the animal in being caught is made to set the trap for the next comer.

674 Greenhood & Newbauer, San Francisco: mammoth sample of Coal from the Eureka Coal Co's mine, Mt. Diablo. This block of coal weighs 5,225 lbs.

An enterprising miller in Fredericksburg has been employing the country people in Spottsylvania to bring in the bones of horses and cattle from the battle-fields and swamps in that region. The large quantity of this material in that section of northern Virginia will render the business profitable.

ART GALLERY CATALOGUE

—OF THE—

Fifth Industrial Exhibition of the Mechanics' Institute.

—Annie J. Columbit, aged 7 years:
1 Crochet Tidy.
2 Two Lamp Mats.

734 Residence of C. Low.
735 Residence of T. Day.
736 Hough & Baldwin's Residence.
737 Telegraph Hill.
738 Residence G. P. Swift, Sonoma.
739 House on Rincon Hill.
740 House on Howard Street.
741 Lone Mountain Views.
742 Thos. Day's House.
743 Pacific Female College, Oakland.
744 Capt. Macondray's Grave, Lone Mountain.
745 D. Rice's House.
746 Smith Park.
747 Graves at Lone Mountain: Toland's Medical College; House cor. First and Harrison streets.
748 Tomb of Jos. S. Garwood.
749 Mrs. C. Lobree: Table Cover.
750 Mrs. Mary A. Engle: Worsted Wreath.
751 L. Klein: Photo. Views of Post Office; Orphan Asylum; Peter's Burial War-horse; Grave at Lone Mountain, and five Residences.

—Winter:
752 Interior of St. Malchus, Paris.
753 Departure of the Israelites from Egypt.

—F. Mezzara, 421 Jackson street:
754 Bust of C. P. Lott in Plaster.
755 Bust of F. Rudolph in Plaster.
756 Bust of T. Torquet in Plaster.
757 Bust of D. C. Broderick in Plaster.
758 Bust of J. C. Baldwin in Plaster.
759 Glass Case of Cameo Pins.
760 J. H. Rossiter: Photograph of Dog "Cæsar."
761 Mrs. Louisa McGinn: Samples of Fluting.
762 Miss M. J. King: Embroidered Pin Cushion.
763 W. H. Davenport: One Crochet Tidy.
764 Mrs. P. C. Blunt: One Maple Sugar Bowl, over one hundred years old.
765 C. L. Houghton: Crayon Drawing, "Over the River."
766 Mrs. E. McGinnis: Ornamental Pin Cushion.
767 Mrs. Mark Anthony: Fancy Skirt, stitched by hand.
768 769 Chas. Hobbs: Two Oil Paintings, painted by Thos. Hall.
770 Lazzarus Castagino: Inlaid Picture of Garibaldi.
771 Miss Ida V. Doyle: Specimen of Cheuille Embroidery.
772 D. Mojica: one Guitar.
773 James A. Kerr: Water Color Drawing, scene in Russia.
774 G. W. French: Chain and Wooden Pincers.
775 Mrs. H. N. Fullam: Last Council of War, in Shell Frame.
776 Mrs. H. N. Fullam: Shell Frame.
777 Mrs. Clara W. Chapman: piece Cheuille Embroidery.

—Mrs. Read:
778 One Ladies Waist.
779 One Case Skirt Supporters.
780 J. E. Wolf: Architectural Drawing.

—Bradley & Rulofson, Photographs:
781 Gen. Satter, the Hero of the Bear Flag.

—Mrs. J. A. Whipple:
896 One Piece of Embroidery.
897 Pair of Embroidered Slippers.
898 Cameron, Kuenzie & Mills: Glass case of Album Stereoscopes.
899 John N. Class: One Frame, made of California jewels

—Fortunato Arriola: Oil Painting.
900 Portrait of Mrs. Reslo, taken from a photograph.
901 Portrait of Mrs. H. P. Janes, from a carte de visite.
902 Mr. Ralston, from a photograph.
903 Miss Emma Hall, from life.
904 Mrs. Wade's Deceased Child.
905 Mrs. Bacon.
906 F. Arriola, painted by himself.
907 Miss Ida Owens.
908 Mr. Hall, from a carte de visite.
909 Miss Gage: One Case Patterns for Ladies' and Childreu's Clothing.
910 Cameron & Kuenzi: Specimens of Scroll Sawing.
911 Mrs. N. G. Kittle: Embroidered Chemise.
912 Mrs. N. G. Kittle: Embroidered Pillow Slip.
913 to 915 John Stratman: Cartes de Visite, Cups and Saucers.
916 John Statman: Masonic Picture, colors made to represent pearl.
917 Mrs. Judge Pratt: Representation of Crucifixtion, made of Oregon Mosses.
918 Capt. Henry Tucker: Engraving of Gen. Washington, the only article of Furniture saved from the Ship Sophia Thornton, when destroyed by the Shenandoah.
919 Thos. Selby & Co.: View of Shot Tower, cor. of Howard and First street.
920 Louis Schuch: Case of Meerschaum Pipes and Meerschaum Ambers.
921 Mrs. Emily P. Bailer: Worked Skirt.
922 Mrs. Emily P. Bailer: Worked Skirt.

—Charles F. Jones, Chinese Curiosities collected during the Rebellion in 1863, 1864, 1865, viz.:
923 Bamboo taken from the Palace at Ye Sing.
924 Shawl one of the Wives of the Tee Wang, at the City of Le Yang.
925 Ancient China Cup.
926 Small Chinese Josh, 200 years old.
927 Musical Instrument.
928 Chinese Scissors.
929 Flint, Tinder and Steel.
930 Tongue Cleaner.
931 Eagle, carved from the root of a Tree.
932 Chinese Coarse and Fine Comb.
933 Chinese Knife.
934 Chinese Purchase Stones and Curiosities.
935 Tulping Woman and Shoe.
936 Foot Warming Pan.
937 Mandarin Stamps.
938 Chinese Shoe-lift.
939 Silver Chain.
940 Jacket of the Wangs.
941 Chinese Curtain Holders.
942 Bottom of Ladies Trowsers.
943 Tulping's Head Dress.
944 Gold Medals, presented to Mr. C. F. Jones, by the Emperor of the Tulpings.
945 Piece of the Covering of the Throne at the Palace where the Emperor was Murdered.
946 Jade Stone, a precious stone of China.
947 Silver Bangles, captured at the battle of Tsing Poo.
948 Rice Stone.
949 Silver Bangle, taken at Pre-shape Grand Canal.
950 Jade Stone Buckle.
951 Model of Chinese Boats.
952 Opium Pills.
953 Chinese Needles.
954 Sewing Silk.
955 A very Ancient Dish.
956 A very old Josh.
957 Pair of Eye Glasses.
958 Aromatic Fan, from Calcutta.
959 Fan from Bombay.
960 Box of Needles.
962 Two Trays, taken from Chung Wong's Palace.
963 Carved Food-board of Redstead, taken from the Palace of Mowang.
964 Two Eggs, made of Alabaster.
965 Paper weight, made from Elephant's Tooth.
966 Signal of Marriage, with high Mandarin and Lady.
967 Opium Pipe.
968 Bracelets.
969 Coins of China and India.
970 Chinese Imperial Mandarin.
971 Taiping, or Rebel Chief.
972 Pure Gold Taiping Pins.
973 Pipe, taken at the fall of Tsing Poo.
974 Lot of Curiosities, taken at the battle of Morlin.
975 Show Case of Coins and Curiosities from all parts of China.
Twelve Pictures from celebrated Palaces in the Cities of Le Yang, and Foo-Chow-Foo.
976 Mrs. Henry Bradt, Red Bluff: Portrait of John Brown, painted from a photograph in possession of his widow; said to be the best likeness extant.
977 Mrs. Matilda Clements: One Embroidered Child's Sacque.
978 Capt. Edgar Wakeman: One Mahogany Tea Chest.
979 Miss Gage: One Wax Statue.
980 Mr. S. P. Higgins: One Fruit Piece.
981 Industrial Drawing Academy: One Pencil Drawing.
982 Master H. T. Barrett: One Toilet Cushion.
983 C. F. Richards: Colored Mosses and Pearl-shell in frame.
984 G. F. W. Richter: Seven Dyed Hen's Eggs, engraved with the point of a pen-knife.

A New and Harmless Remedy.—It is well known that nearly every animal and insect has an unconquerable aversion to some particular plant, and that what will kill certain animals or vermin can be eaten with impunity by others. The oil of pennyroyal will drive every mosquito out of a room if scattered about, even in very small quantities. The inner bark of the white ash will, if brought in contact with a snake, stiffen him like a stick in an instant; and a bit of fresh tobacco placed on his tongue will kill him as dead as if struck by lightning, while sheep and goats feed upon it, if pressed, with entire impunity. Roaches are exterminated by scattering a handful of fresh cucumber parings about the house. No fly will light on a window which has been washed with water in which a bit of garlic has been boiled. The leaves of a common Japanese plant, which can be eaten in any quantity by the human race, kills every species of rat, mouse and creeping thing, and forms the basis of "Costar's" and all other effective "rat exterminators." We might go on with the list almost indefinitely, but have quoted examples enough for our purpose. Alexander Robertson writes to the *Canada Farmer*: "I have for the last four years proved to my satisfaction that the "Wild Peppermint" is a sure and reliable exterminator of rats. In proof of the fact, I will state the result it has had with me. Four years ago my barn was regularly infested with rats; they were so numerous that I had great fears of my whole grain crop being destroyed by them after it was housed; but having about two acres of Wild Peppermint that grew in a field of wheat, after the wheat was cut and harvested the mint was cut and bound with it, and it drove the rats from my premises. I have not been troubled with one since, nor am I at present, while my neighbors have any quantity of them. I feel confident that any person who is troubled with these pests, could easily get rid of them by gathering a good supply of the mint and placing it around the walls or base of their barns.—*Alta.*

They have succeeded in catching fish in France by means of an electric light. The light was produced by a powerful electro-magnetic machine constructed by Monsieur Bazin, the well-known engineer. The experiment was conducted by M. Bazin on board the Andalouse, in the presence of fifteen hundred persons. The light, in a lantern, was submerged in the water, and the fish came to it in shoals while the fishermen caught them in their nets. M. Bazin is shortly to proceed to Bona, in Algeria, and establish a coral fishery by the assistance of his electric light. He proposes in the meantime to descend full four hundred feet into the sea, and explore the "depths of the ocean" with his submarine instruments.

The Germans do not have the word "churchyard and burying ground" to designate their places of interment; they use the beautiful and suggestive expression, "God's Acre" and the "Court of Peace."

W. BRUCKNER'S ROASTING FURNACE.

In most and best metallurgical works the operation of roasting the ore has been, till now, performed in reverberatory furnaces. As a good result in the yield of the precious metals depends much upon a well conducted roasting, much care and attention is generally bestowed on its process. Skillful and experienced workmen are indispensable, as any carelessness or want of observation may cause heavy losses.

Now, there are two principal difficulties which must be overcome in the roasting operation:

The first of these consists in the necessity of continually stirring the ore, in order to expose all the particles of it to the combined action of heat and air, and to prevent them from melting and caking. For this purpose the pulverized ore is spread out over the hearth of the red hot furnace, and the workmen are required to stir it in a uniform way, and without interruption, with an iron hoe. It is an important point in this manipulation, that the heat is neither too high nor too low, and that all the particles of the ore are exposed to the oxydizing influence of the flame in the same degree.

The second difficulty consists in the following: It must be borne in mind that, in a reverberatory furnace, the heat will always be stronger nearest to the fire-bridge than in the other parts of the furnace; this being a fault attached to all furnaces where the heat is created by the flame of the fuel, and which has not yet been overcome, nor will it likely ever be. This circumstance involves the necessity of moving the ore, from time to time, from the flue to the fire-bridge and vice versa. It is easily understood what a tedious and troublesome operation this must be with a quantity of half a ton, or a ton of ore in a space extending over an area of from ten to twelve feet in length, and eight and more in width. In a well conducted roasting this transplacing of the whole bulk of the ore is necessary at least once every hour, and each furnace requires, therefore, not less than three workmen.

In order to lessen the expense for labor in roasting, attempts have been made for a long time, to apply mechanical force to the operation of stirring and transplacing the ore. Parke's roasting furnaces, now in use at the Pembrey Copper Works, consists of an iron stirrer, turning round a vertical axis on a round horizontal hearth. In other inventions revolving hearths and revolving cyliuders, for various arrangements, have been devised for a long period.

Although a revolving cylinder, in which the flame enters at one open end and leaves at the other, evidently fulfills very well one of the two principal conditions which have been laid down in the above as necessary for a good roasting, namely, that of continually renewing the surface of the ore, it does not overcome the other difficulty; that is, the moving of the ore from the comparatively cold end nearest to the flue to the fire-bridge and back. Hence it appears that as long as there did not exist a sufficiently plain and effective way of moving the ore in the direction of the axis of the cylinder, as well as along its circumference, the process could not be considered a perfect one.

By numerous experiments, which Mr. Bruckner has made, for the purpose of overcoming this difficulty, he has succeeded in inventing a stirring apparatus which has proved to perform the operation of moving the ore in the direction of the axis of the cyliuder in the most satisfactory way. It consists of converging conveyors, fixed diagonally upon the inside of the horizontal revolving cylinder, and constructed opposite each other, and in opposite directions, in such a manner that in every revolution of the cylinder the ore from the hotter parts, nearest to the fire-bridge, is transplaced to the comparatively cooler parts, nearest to the flue, and thence back by the opposite conveyors, thus exposing the ore to the uniform action of the heat.

Besides this, conveyors are arranged in such a manner, in combination with the discharge hole in the middle of the cylinder, that when the aperture is opened, the ore is discharged in a few revolutions.

The furnace, which was exhibited and in operation at the Fair, is nine feet long by three feet, inside diameter, and is capable of roasting three tons of sulphurets in twenty-four hours, with one cord of wood. One man can attend to six of these furnaces. It can be set up in less time and with less expense than a reverberatory furnace. The power to drive the machinery is very small; one man can easily turn it.

This furnace can be used for oxydizing roasting, for chloridizing roasting, with or without steam; for roasting auriferous pyrites, or any other gold, silver, lead or copper ore of any per centage of sulphurets. It may be used, too, for calcining ore in pieces before crushing.

A patent has been applied for. The following estimates, which are made within correct bounds, will show most plainly the superior advantages of this new furnace over the old process.

Five Tons of Ore are Roasted in Twenty-four Hours, in Washoe in Four Reverberatory Furnaces:

With 12 Men, at $3.50	$42 00	
3½ Cords of Wood, at $12.00	42 00	
500 lbs. Salt, at 50c	25 00	
	$109 00	
Cost of Roasting per Ton	21 60	$21 80

Five Tons of Ore are Roasted in Twenty-four Hours, in Bruckner's Furnace, in Two Furnaces:

With 1 Man, at $3 50	$3 50	
2 Cords Wood	24 00	
500 lbs. Salt	25 00	
Moving Power, 7 per cent. of a 30-horse power engine	3 50	
	$56 00	
Cost of Roasting per Ton	11 20	
		$11 20
Saved per Ton		$10 60

EXAMPLE.—Speaking of the contagiousness of example the New Orleans *Bulletin* remarks; "Throw a boy among a set of vagabonds, and he soon becomes like them. Put a strong enlightened man of point and pith and principle among savages, and at last he makes them civil, otherwise he becomes savage. The contagious tio forces begiu instantly to operate, and the weakest one must give way, so that in process of time the mass becomes homogeneous. The laws hold good morally as well as physically. There is a fitness of things which nature has established, and like has a constant tendency to produce like. Thrift induces thrift. Dilapidation throws a deadness over all surrounding objects. It chills and benumbs everything in its neighborhood. The birds flap their wings lazily and the insects creep about as though a paralysis were upon them. A nest of old rotten shanties in a street is a dead sea of blight. The people will soon correspond with them. The dogs will be mangy, and the chickens look old before their time. The children will be half asleep and move as though it were a labor. Nothing is active under such circumstances but the law of assimilation. That is in full force. Everything is in a slow pace towards a common likeness."

THE LONG AND SHORT TON.—The Iron and Steel Association at their recent meeting in Chicago, adopted a resolution in favor of the use of the ton of 2,000 pounds in all transactions. The discussion upon the subject showed that through the action of the internal revenue laws and the regulations of many railroad companies, 2,000 pounds is in large use throughout the country, that many iron workers now employ no other ton in their accounts, while a few keep their accounts in tons of 2,240 pounds, but discard the cwt., quarters and pounds, while others buy by tons of 2,240, and calculate their freights and taxes by 2,000 pounds. The reasons of those opposed to the universal use of 2,000 pounds were of a local character. The books in use were ruled for 2,240. The contracts on hand were for the long ton; the scale of wages were calculated on the long ton, but no reason of a general nature, and none satisfactory to the convention was urged by the advocates of the ton of 2,240 pounds, of whom there appeared to be but few in the body.

THE WEST POINT FOUNDRY.—A writer describing this military establishment, observes: During my visit I learned that since the war began, over three thousand cannon have been manufactured here for our government—the Parrott gun exclusively—varying from those of medium calibre to three hundred pounders. These guns have done duty in our forts, on our gunboats and in our grandly moving armies, so sublimely sweeping through the hostile Southern States. One of these three hundred pounders weighs twenty six thousand pounds or thirteen tons. One was being cast as I visited the place. It was a sight worth traveling hundreds of miles to see. These guns are submitted to the severest tests before turned over for service. The precipitate banks of Crow Nest are the target of the experimental trial, the distance fired being two thousand yards. Two huge bared spots with deep indentures in the rocks, attest the accuracy of the range and force of the firing. At all hours of the day for the past four years the firing of these guns has awakened fearful echoes among these environing hights, oftentimes sounding like the roar of a terrible battle.

ENTOMOLOGICAL SPECIMENS.—To preserve entomological specimens, M. Gerber employs an ethereal solution of carbonic acid with ten per cent. of the latter, which he finds to effectually protect the insects even in a place infested with ants. He recommends the solution especially, therefore, to entomologists making collections in hot countries.

MOUNTAIN OF MARBLE.—About one mile from Silverthorn's bridge, says the Red Bluff *Independent*, which crosses McCloud river, towers to the clouds a gigantic mountain, white as if clad in the livery of a ghost, at the foot of which is located Lee & DeLong's marble quarry, from which they take both the white and clouded marble, of as fine quality as that imported from the Green Mountain State. The whole mountain appears to be one vast pile of marble, of quantity sufficient to supply the world. It receives a finish as fine and smooth as glass, or like a polished mirror. The great and remarkable cave, one room of which is 100 feet in length by 40 feet in breadth and 70 feet high, is near this marble quarry. It is a curious place to visit and fully worth an excursion to view the wondrous works of Nature in that section of the country. The quarry and cave are only some five miles from Copper City, Shasta county.

AN OIL WELL ON FIRE.—A despatch from Pit Hole, Pa., August 3d, mentions that Well No. 19, United States Farm, on Pit Hole Creek, was destroyed by fire about seven o'clock on that evening. The well was finished on the day preceeding, and was flowing about two hundred barrels, and no tanks being up, the oil was allowed to flow on the ground. Some twenty persons were standing in and around the derrick, some of whom it is feared were unable to escape, for the ground for forty feet round was one sheet of flame in a moment. Three men are known to be seriously burned, and only saved their lives by jumping into the creek.

A "PERPETUAL MOTION CLOCK" is being exhibited at the New Zealand exhibition, and there is said to be no deception in its construction. A correspondent of the *Scientific American*, from Nelson, New Zealand, says, the inventor has had a clock openly going in his house for the last fifteen months without being touched, and there seems no reason why it should not continue to go as long as the material will wear.

HOURS OF LABOR.—Eight hours for a day's labor, is the last idea discussed among the mechanics of the Eastern States, with a view to having it adopted by the Legislature. As machinery increases in productive power, mechanic's labor decreases, not because machinery supersedes it, but because it contributes so largely to wealth and cheapens produce that a man can enjoy more of the comforts of life with less labor. The tendency of the accumulation of wealth is all the time to diminish the necessity of labor for a mere living, and consequently affording more time to labor to procure some of the luxuries of life.—[*Philadelphia Ledger.*

THE leaves of the elder, if strewed among corn or other grain, when it is put in the bin, will, it is said, effectually preserve it from the ravages of the weevil. The juice will also kill bed bugs and maggots. "Insects never touch elder bushes. The leaves of elders scattered over cabbages, cucumbers, squashes and other plants subject to the ravages of insects, effectually shield them; the plum and other fruits may be saved by placing on the branches, and among them, bunches of the leaves."—*Exchange.*

TRAVELING BOTTLES.—A number of empty bottles have been thrown into the sea on the west coast of Africa, and have been picked up on the Irish coast. One has been found after sixteen years, another after fourteen, and a third after ten years. One was thrown into the Caribbean Sea, and after five days was picked up two hundred and ten miles distant. A bottle was thrown in at Behring's Straits, and two hundred days afterwards was found on the Honduras coast, having traveled three thousand five hundred miles.

A SINGULAR accident is said to have happened at Springfield, Mass., recently. A five-foot drive-wheel for a locomotive, just from the foundry, was lightly tapped with a hammer by a workman, when it burst, and a portion of the rim and several spokes, in all nearly a quarter of the entire wheel, flew some fifteen feet, but fortunately injured nobody. There was a similar accident a few days previous, when a workman was wounded in the leg. These are the only instances ever known at the shops in that city.

WASHINGTON IRVING once said: "If a Dutchman gets rich keeping a corner grocery, nobody sees anything out of the way in it; but if a literary man gets anything beyond his bread and cheese, "gad sir, they put it into the newspapers; its more wonderful than the great turnip."

INJURIES BY RAIN.—During the two last weeks in July, which is the harvest time in the Western States, it rained almost incessantly through Ohio, Indiana, Illinois, and portions of Iowa, Missouri, and Michigan. The damage sustained by farmers is immense. It will reach to many millions.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, September 16th, 1865.

There is no new feature apparent in the condition of the money market. Capital seeking investment and for loan purposes is as plentiful as ever, and the rates of interest are tending downward. Bank accommodations rule for the most part at 1½ ₱ cent. per month; but loans upon bond and mortgage are made at 1 ₱ cent. per month, and we are apprised of certain negotiations, of an exceptional character, based upon prime collaterals, at 10 ₱ cent. per annum. Very little money is at present required for mercantile purposes, although some improvement in trade may be noted, and unexceptable names can be placed at 1@1½ ₱ cent. per month.

Receipts of treasure from domestic sources, since Saturday last, amounted to $1,200,000, making an aggregate of $2,100,000 thus far during the current month. The Branch Mint in this city, since the 1st inst., has taken about $1,150,000 for coinage.

There is a small supply of bullion on the market, and up to the present moment an active demand for shipment. Gold bars have been sold at 836@840, which was the range of prices yesterday. Silver bars are selling at ¼ ₱ cent. premium to 1 ₱ cent. discount for round lots.

The mining share market has exhibited more life this week, and although the prices of some stocks have been rather irregular, and no important advance may be noted in others, the aggregate transactions show a large increase over last week, and a number of shares are firmly held at the close at enhanced rates. City stocks, with scarcely an exception, continue in favor at higher figures, and such as are paying dividends are sought for by parties desiring to earn current rates of interest for their idle capital. There has been also a speculative demand for some of these shares, but to the easy condition of the money market is the late rise mainly attributable.

Pacific Insurance has obtained decided favor recently, and at the close is inquired for at $185—an advance of $35 per share during the past thirty days. San Francisco Gas has also materially improved, and is in demand at $99 bid, $100 asked. Spring Valley Water is quotable at about $51 bid, and California Steam Navigation was sold at $840, closing at $820 asked, ex-dividend of $20 per share, paid yesterday. North Beach and Mission Railroad is in some favor at $41 per share bid, and Omnibus Railroad is inquired for at $39½.

Alpha has attracted more attention, and small sales were made, advancing from $1.950 to $2,060, and closing at $2,075 bid. The second week's crushing of the company's new mill realized some $20,000 from about $350 tons of ore, and the same result is anticipated this week. The product of the mine is averaging 75@80 tons of ore per day, mainly from the 350-feet level. The drift running north from the 70 feet incline at a depth of 590 feet, to intersect the main shaft, continues in a body of fine ore, some 30 feet in width, and arrangements will soon be made to hoist considerable ore from this part of the mine.

Yellow Jacket has been quite active, and some 100 feet changed hands, receding from $1.460 to $1,400, rallying to $1,440, declining to $1,390, then selling at $1,335, and closing at $1,360@1,340. During the week ending 3d inst., 1,250 tons of second-class ore were extracted from the mine, and 2,237 tons of same class were reduced, yielding $69,759,36, an average of $31.18 per ton. The Morgan Mill is in complete running order, capable of working and amalgamating 90 tons of ore per day. The machinery on the Princess shaft, at the north end of the mine, will, it is thought, materially reduce working expenses, as well as assist in exploring for new bodies of ore. The south shaft is now down 340 feet, and the machinery of the Best & Belcher Co. has been purchased, at a cost of $20,000. An additional expenditure of some $18,000 will be required in its removal, replacing buildings, etc.

Gould & Curry rose from $1,290 to $1,340, and is now in some request at $1,300 bid, $1,350 asked. In addition to the company's mill, the Hoosier State, Booth's, and Bassett's mills are now employed, giving a reduction capacity in all of some 150 tons of ore per day. The average yield of the mine exceeds that amount, and receipts of bullion this month are likely to compare favorably with those of August.

Savage receded from $1,220 to $1,200, rose to $1,310, then sold at $1,220, and was dealt in yesterday at $1,240. The drift in the lower level has reached the air shaft from the fourth station above, and is said to disclose a promising deposit of ore. The yield of the mine now exceeds an average of 100 tons per day, and receipts of bullion are expected to show an increase this month.

Crown Point rose from $1,120 to $1,150, fell to $1,125, and sold yesterday at $1.120@1,125, within which range some 40 feet changed hands. The company's two mills are kept constantly at work upon ore mainly taken from the 260-feet level, and the lower level drift is now in about 75 feet from the shaft.

Belcher has been moderately active, within a range of $895@925, closing at $917½.

Ophir has attracted considerable attention, and 262 feet were sold, advancing from $365 to $440, buyer 30, receding to $380, then selling at $387@392½, and closing yesterday at $405. We can learn of no new developments in this mine; but are informed that the suit of the Moscow company has been postponed until November. From the Ophir north mine and the old dump pile, some 20 tons of ore are now daily sent to the two mills. A second shipment of bullion has been received this month, making in all about $25,000 thus far.

Chollar fell from $460, buyer 10, to $440, and closes at $450, ass't delinquent, some 100 feet in all changing hands. Potosi was dealt in to the extent of 85 feet, receding from $420 to $405, closing at $450 ass't delinquent. The ore extracted from these two mines last month amounted to 3,600 tons, and the net product, after paying for its reduction, amounted to $48,500 ($13.50 per ton), less $17,500 for mining, hoisting, etc., showing a clear profit of about $8.60 per ton over and above all expenses.

Empire Mill and Mining Co. has been in less favor, and some 62 shares were sold, declining from $380 to $340 per share, and closing at about $355 bid. The receipts of bullion last month exceeded $50,000, the product mainly of low-grade ores taken from the upper levels. After the disbursement of some $25,000 for winter supplies, litigation, etc., a balance of about $6,000 was left in the treasury of the company on the 1st inst. The yield of the mine will be materially increased as soon as arrangements can be perfected to hoist from the lower level through the main shaft. Bacon was sold at $250 per share, and is now held at $230. Hale & Norcross was dealt in to the extent of 89 feet, within a range of $520@490, closing at $505.

Imperial is still a feature of the market, and more than 1,000 shares were sold, advancing from $257 to $270, ex-dividend, receding to $254, and changing hands yesterday at $252@253. The sixth-level drift, 175 feet from the shaft across the vein, now discloses a body of fine ore, some 40 feet in width, and the east wall of the ledge is supposed to be at least 40 feet distant yet. The reserve of ore at the Rock Point Mill will be increased to 3,000 tons this month. A report will be presented to the stockholders to-day for the quarter ending August 31st. During that period, 7,187 tons of ore were treated at the company's mills and 104⅜ tons at Dall's mill, producing in the aggregate $327,031.47, or an average of $45.45 per ton. Receipts from other sources, and the balance on hand at the end of previous quarter, amounted to $7,268. The disbursements have been as follows: Milling expenses, $87,885.97; mining, $42,956.35; assaying, treasure freight, and Federal tax, $7,240.24; property purchased and permanent improvements made, $10,021.21; general and legal expense account, $33,600 15; Superintendent's balance, $59.21; dividends paid, July and August, $80,000; discount account, $1,662.03; cash on hand, August 31st, $70,875.66. After the payment of a dividend of $40,000 on the 10th instant, a balance of $30,875.66 remained in the treasury of the company. This is a flattering exhibit. The first "clean-up" this month amounted to $17,500, showing a better average yield per ton than in the corresponding period of August.

Sierra Nevada has been active, at fluctuating rates, and some 1,500 shares were sold, declining to $19, rising to $23, and closing at $21. An assessment of $7.50 per share was levied on the 4th inst. Bullion rose from $135 to $140, fell to $137, and closes at $132. An assessment of $16 per share was levied on the 10th inst. Daney has been well maintained, and some 600 feet were sold, rising from $40 to $55, dropping to $42, rallying to $50, receding to $42 again, and closing yesterday at $44.

Burning Moscow was dealt in at $20@23, closing at $22. North American fell to $15, rose to $20, and sold yesterday at $17. Nevada (J. G.) fell from $27½ to $15, seller 30, rallied to $19, and closed at $23. Kentuck was sold at $65, and Segregated Crown Point at $25.

The aggregate sales of stocks since Saturday last amounted to $822,056.

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Sept. 16, 1865.

IMPORTANT COAL DISCOVERY.

The *British Colonist*, published at Victoria, reports an important coal discovery as having recently been made at or near the Queen Charlotte Coal Company's mine. A quantity of this coal has been tested at the foundry of Messrs. Spratt & Kriemler, at Victoria, with the most satisfactory result. About half a ton of iron was smelted and the coal was pronounced by the workmen to be of a most superior character for the purpose, and equal to the celebrated Pennsylvania coal, the heat-giving properties being intense, with an absence of sulphuric gasses which renders the ore softer and purer. This coal, the *Colonist* thinks, is likely to be held in high favor in the foundries and smelting works on this coast. An analysis of the coal has been made by Mr. F. Claudet, of the Government Assay Office at New Westminster, with the following results:

Moisture	5.10
Volatile combustible matter	17.27
Carbon	71.20
Ashes	6.43
	100.00
Specific gravity	1.46

This analysis is much more favorable than any we have yet seen of coals produced on the Pacific coast, and makes quite an approximation towards a true anthracite. A great point gained in this coal is the entire absence of sulphur and the small quantity of moisture present. The coals on this coast, heretofore discovered, contain so much sulphur as to render them useless for smelting purposes, except in reverberatory furnaces—a class of furnace requiring such an excess of fuel as to render them inapplicable for smelting, at anything like the present cost of fuel in California.

All the California coals are of the character known as lignites, the chief characteristic of which is the notable quantity of water which they contain, and which they will not part with even after a free exposure to the highest natural atmosphere of this climate. As a consequence, this moisture must be evaporated at the expense of their combustible constituents. Lignites thus contain from twelve to twenty per cent. of moisture. There has probably been no coal hitherto produced on this coast, which contains less than fifteen per cent.; the newly discovered Victoria coal, however, contains but a small fraction over five per cent. The anthracites generally employed for smelting purposes in Europe are entirely free from moisture, after being submitted for a short time to the free action of the atmosphere.

In order that the reader may the better judge of the value of this new coal, we compare it with several of the European coals used for smelting purposes; also with the Pennsylvania anthracite—and the lignite near Virginia City. We have no analysis at hand of any of our California coals, and indeed we are not aware that any have been made:

SWANSEA, ENGLAND.

Carbon	90.00
Combustible Gasses	7.70
Ashes	1.72

ERNANI, SPAIN.

Carbon	70.00
Combustible Gasses	.00
Ashes	24.00

YSERE, FRANCE.

Carbon	91.90
Combustible Gasses	6 30
Ashes	2.70

PENNSYLVANIA ANTHRACITE.

Carbon	86@88
Combustible Gasses	8@ 8
Ashes	4@ 6

NEVADA, CALIFORNIA

Carbon	39.76
Combustible Gasses	29.14
Ashes	11.14
Moisture	19.65

LOCALITY, UNKNOWN.

Carbon	97.25
Silica, Alumina, Oxyd of Iron } Ashes	2.75

We find the last analysis on the authority of Hericart de Thury, from the *Journal des Mines*, without any mention of the locality from whence it came. This omission is much to be regretted from the fact that the coal is very remarkable in its character, and the fact that, according to this analysis, it is entirely destitute of volatile matter, and contains the largest amount of carbon of any coal of which we have been able to find any analysis (and we have a very large number of analyses before us as we write). The largest amount of carbon in any English coal is ninety-one per cent.; and eighty-eight per cent. is the highest of the Pennsylvania coals. In Percy's Metallurgy, page 81, that author states that oxygen and hydrogen are *never* entirely separated from coal; but are *always* present to a sensible extent. The analysis of Thury would seem to prove that coal is found in France which has parted with *all* its volatile matter, and presenting 97.25 per cent. of carbon, the nearest approximation to the diamond of any known substance.

Geologists apply the term lignite to those carbonaceous minerals which occur in the latest and above the true coal measures. It is sometimes very difficult to distinguish between the lignites and the true bituminous; as it is also between the latter and the true anthracite. In fact the one runs into the other, by the most imperceptible degrees. Whatever opinion may exist as to the mode of the accumulation of coal—whether from deposits like peat, from drift wood or from wood *in situ*—there can scarcely exist a doubt as to its being the product of the gradual decomposition of vegetable matter under certain special conditions. All coal was no doubt originally lignite, the earlier deposits of which have been gradually changed to bituminous, and from that to anthracite. Hence the difficulty of drawing a dividing line between them.

THE SINGER SEWING MACHINE.—Without contradicting the volumes of extravagant praises with which other leading sewing machines are belabored, it must candidly be admitted that the Singer is all that a prudent and elegant housewife could desire, while to the manufacturer it has superiorities over all other inventions. These are sufficient reasons to justify the immense popularity which these machines attain wherever they are introduced. Mr. Broderick, the agent of the Company in this city, is a worthy gentleman, a mechanic, and an active member of the Institute. Be sure and examine the Singer machines.

LANCHA PLANA COPPER MINING COMPANY.—At the annual meeting of the Lancha Plana Copper Mining Company, held on Friday, Sept. 8th, the following gentlemen were elected Trustees for the ensuing year. O. D. Lambard, J. Larned, J. D. Lord, Geo. A. Conrad, and C. H. Huffman. And at a meeting of the Trustees, held the same day, O. D. Lambard, Esq., was re-elected President; J. Fuller, Secretary and Treasurer, and C. H. Huffman, Superintendent. The mine is reported to be in a very promising condition.

THE London correspondent of the Boston *Commonwealth* says that Lord Brougham is broken down and in his dotage. He walks with steps two or three inches long, and has forgotten the names of his friends.

[From the DAILY FAIR PRESS of Saturday, Sept. 9.]

END OF THE FAIR.

The affairs of men, in the reckoning of events, relate only to time. In obedience to this law, the Fifth Industrial Exhibition of the Mechanics' Institute, is about drawing to a close. After the bell has struck to-night, and the band discoursed its familiar "Home, Sweet Home," for the last time, the immense concourse of visitors will take their departure, the lights will be extinguished, and none left but the faithful guard, to keep watch over the articles which have contributed so largely to general instruction and entertainment. After the goods have been removed, the spacious Pavilion with its wide-spreading dome, reminding one of the storied St. Paul's, will be torn down, and its timbers borne off, that the grounds which they occupied may again revert to the purposes for which they were originally set aside and dedicated.

There is little doubt but the recollections of this Fair will endure for years. They have been delightful, (as we are led to judge from an almost constant attendance) to both visitors and exhibitors. The worthy President of the Institute has exerted his best energies, with an affability of manner that did him great credit, to afford complete satisfaction. The excellent Treasurer has never been remiss in duty, nor in the slightest degree untrue to his trust. In fine, the Executive Committee, as a unit, so far as we are able to learn, have discharged the delicate and difficult responsibilities entrusted to them, in a manner to give general satisfaction. The energetic Superintendent, from the beginning, has manifested an untiring zeal that rendered him almost ubiquitous in the discharge of duty. His adroit management harmonized all asperities and silenced all inconsiderate growlings. The Clerks have manifested a praise-worthy fidelity at their respective posts. In fact all have been vigilant, active, attentive, polite, and accommodating. In our editorial walks we have had, on numerous occasions, to tax their patience, and it gives us pleasure to bear witness to their uniform good nature and generosity.

It is a fact, perhaps, that the Fair, as an Exhibition of the aggregate inventive genius, manufacturing ability, agricultural productions, and mechanical skill of the State, fell short of what it might and ought to have been. There are several causes for this result. California has recently passed through two consecutive years of drouth, which not only injured the arable qualities of her soil, but impoverished many of her most enterprising citizens. The State Fair always interferes more or less with this; and besides, the present season, there were two or more District Fairs, which kept many articles away that might otherwise have been found in the Pavilion.

In taking adieu of our friends and patrons, it may not be out of place to say, that our own humble abilities have been exerted to the utmost to give *eclat* to the Exhibition. We have published a daily paper in the Pavilion, tens of thousands of copies of which were gratuitously distributed among visitors. Our advertisers have been treated with as much liberality as it was possible to extend without too great a pecuniary sacrifice.

The large and elegant cabinet of minerals, fossils and curiosities, in the Fair, were sent in response to our solicitation, from all portions of the State, and exhibited under the especial auspices of the proprietors of the MINING and SCIENTIFIC PRESS. It is their cabinet, in trust; a statement which is by no means intended to rob Capt. AIKEN of the proud distinction of having arranged and classified that beautiful collection of minerals, ores, sulphurets, etc., in the glass show-cases, which have been so universally admired, and are a source of just pride to the State; nor in any manner to deduct from the high praise due his patient attendance, intelligent explanations and courteous bearing towards inquisitively curious visitors. Our belief is a conviction and our hope a sentiment, that the Committee of general award will not place too cheap an estimate upon either the merits of his collection, or the value of his personal services.

To those contributors who nobly responded to our request, when informed that the Executive Committee had granted us the space for exhibition, and the care of the minerals forwarded to us, we return our sincere thanks, trusting that the grand display in this department will hereafter be repeated as a regular feature of all future fairs.

In this volume, in articles under the heading of "Descriptive Catalogue," [all of which were also issued by us in pamphlet form,] we have striven to notice as fully as practical the merits of everything exhibited in the Pavilion. Wherever we have failed to do so, it has been for lack of information from the exhibitors.

And now, gentle readers of the DAILY FAIR PRESS, good bye. In this vigorous Saxon word there is a world of meaning and feeling. We intend that it shall all be expressed. Our relations have been kindly and pleasant; and although the Fair may dissolve, and the DAILY PRESS, like the swallows in autumn, after their glorious summer revel on free pinion, sink into repose until another season, there will remain happy memories to cheer the heart and strengthen it for the battle which is constantly before it.

MASTER S. C. HIGGINS.—This young amateur artist, as yet self-taught only, exhibits several very meritorous mechanical and other paintings, on the south wall of the north or right hand gallery, at the Pavilion. By some oversight several of these pictures, being very accurately painted elevation views of the locomotives San Mateo, Tiger, and President, all, if we have not mistaken, running on the San Jose railroad, are printed in the catalogue as having been painted in water colors, when in fact, they are painted in oil, and upon paper. The effect of oil upon paper for such work is very superior and much more durable than though done in water colors. The fact that they are or could be so elegantly done in oil, upon such a surface, has been doubted by some; in consequence of which Master Higgings has procured a certificate from the master mechanic and several of the engineers upon the San Jose railroad and others, testifying to the fact, and also to the further matter that they were executed by our young friend himself, without any assistance. Master Higgins exhibits a decided talent in the way of mechanical drawing and painting, and in the latter art has struck out quite a new process of his own in introducing water colors upon ordinary drawing paper. We spent a very interesting hour, this morning, in his studio, on Howard street. Our young friends, one and all, might learn an important lesson by making his acquaintance and seeing how much industry and perseverance may accomplish when rightly applied.

SILVER FROM IDAHO.—The Sierra Nevada on a recent trip brought from the North to San Francisco about $90,000 in silver bricks—the first considerable shipment of that metal from Owyhee, in southwestern Idaho. There are two qualities of ore, one lot being worth $3 25 per ounce and the other $6 40 per ounce. About four-fifths of the amount was of the former quality. One lot of about $57,000 is said to have been the product of 55 tons of ore, while another lot of about $33,000 is the result of 15 tons crushing. Some of the sanguine Idahoans are predicting that their young territory is to excel Washoe as a silver producing country. The facilities, such as wood and water, are said to be abundant in Owyhee.

A FORTHCOMING BOOK.—Robert Dale Owen is writing a "Life of Abraham Lincoln." His publishers give him two years to finish the work. He is paid $3,000 down, and $15,000 when it is finished. There is not a man in the world better qualified for such a work than Mr. Owen, who, besides being a thorough scholar and cotemporary statesman, has been the life-long friend and neighbor of Mr. Lincoln.

THE Constitution of Massachusetts contains the following article, defining the right of suffrage: "Art. XX. No person shall have the right to vote, or be eligible to office under the Constitution of this Commonwealth, who shall not be able to read the Constitution in the English language, and write his name."

Communications.

In this Department we invite the free discussion of all proper subjects—Correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Reese River--Mills and Mines.

CONTINUED.

As promised in my last letter to the Press, I now resume the subject then left off. In doing so I have elected my starting point at "Yankee Blade Cañon," where, foremost amongst the works, that denote the march of improvement and progression, in the due development of the invaluable metalliferous ledges of this district, may be found those of the

CONFIDENCE MILL AND MINING COMPANY.

Foremost amongst the mines belonging to this company, is the "Confidence Ledge," which was accidentally discovered by some men while digging for adobe clay, several feet of which covers the ledge at the surface, contrary to the general rule of ledges here, which almost invariably crop out. The discoverers having sold to Messrs. B. C. Hill and L. H. Newton, in 1864, these gentlemen set to work in true miner-like style, and soon brought this ledge to such a state of development that it attracted the attention of those seeking to invest.

This mine found purchasers in the gentlemen who are now associated with Messrs. Hill and Newton, as the Confidence Company, namely: Mr. W. H. Fearing, Charles Boyden, and Mr. Hazeltine. This mine had to stand the test of scientific inquisition, prior to purchase being made. A most strict examination of it was made by Professor Jackson, of Boston, Professor Clayton, of this place, and Mr. W. C. Marly, of Austin. Upon the report made by these gentlemen, rested the question of investment. It was decided to invest, and, as I am about to show, the gentlemen named did invest most liberally and substantially. I mention these facts to show with what degree of caution capitalists embark in the mining enterprises of this place. These gentlemen purchased three-quarters of the entire mine, which is situated on the same slope of "Yankee Blade Cañon" as the far-famed "Yankee Blade" and Whitlatch ledges, running parallel to them and at a distance of 360 feet, and pitching in the same direction (S. W.), its ore vein stretching from S. E. to N. W. The vein opens at the top eighteen inches in thickness, gradually increases to three feet at its present depth of only ninety-five feet incline—showing a very superior ledge of partially decomposed quartz, containing sulphurets of silver in combination with antimony, some lead, iron, and traces of copper—with regular strakes or stratas of ruby, or antimonial silver. Another of this company's mines is the

REVENUE LEDGE,

Being the first extension south of the noted Whitlach claim; the inclines of both these mines being distant from each other only 160 feet. The Revenue is opened from the top by an incline sixty-five feet, showing a most regular vein, from two feet at outcrop to three at bottom of incline. The ore for the entire distance shows well in chloride, as also other ores of silver, in every particular identical—as far as opened—with the Whitlatch mine. The grounds affording better facilities for the development of this mine by tunneling, as well as working, the company have adopted that method, and are now running a tunnel which is already in some 200 feet, and is now within about thirty feet of the ledge. The Whitlatch company have drifted on their pay vein 100 feet towards the Revenue, developing a splendid vein of ore all the way, and proving most conclusively what may be expected from the Revenue.

LYDIE ALLEN LEDGE

Is another of the Confidence Company's promising mines, located within 300 feet of the Revenue and Whitlatch, and running parallel to them. This ledge is opened by an incline fifty-five feet deep, where it shows very fine sulphuret ore in a vein of two and a half feet thick.

MAID OF ATHENS.

A ledge, also the property of the Confidence Company, is a location on what is known as the "Hazeltine Ledge." This mine resembles in all its formations the Maggie mine, to which it runs parallel, showing at its present depth a fine sulphuret ore. This mine is being opened by an incline running on the vein, which is being done by contract, and like all the other mines and operations of this company, the work seems to be pushed forward as rapidly as a due regard to economy and superior system of carrying on mining operations will admit.

THE HOISTING AND PUMPING MACHINERY

Of this Company, recently put up on the Confidence ledge, is a most perfect model of perfection in the art of constructing such machinery; and may be considered as second to none of like capacity. The engine—a thirty-five horse power—is one of the vertical inverted pattern, with a very fine coiling-reel attached, for hoisting the ore car; as well as all the necessary attachments for working an eight-inch pump, from which a more than sufficient supply of water is obtained for the boiler. The water, as pumped from the mine, is received into a double set of settling tanks, capable of holding 4,000 gallons. This machinery and motive power is fully competent to work the mine to a depth of 1,000 feet—the whole within a fine stately building with boiler room and blacksmiths' shops attached. With the aid of this excellent machinery, work on the mine is being pushed forward with the utmost vigor, under the able and successful management of the worthy superintendent, Mr. L. H. Newton, ably seconded by Mr. R. C. Hill, as foreman. There will be several hundred tons of excellent ore taken from this one mine—according to present appearances—by the time the company's new mill will be ready to start on its reduction, which will be about thirty days hence.

THE NEW MILL

Of this Company is now on the eve of completion, the work on which does much credit to Mr. Evans, as engineer, Mr. Perkins, millwright, and above all to the general superintendent, W. H. Fearing, Esq., that a building of such magnitude as this one is, and built in such a substantial and costly style, could be perfected in so short space of time. The entire building, from foundation to eaves, is of granite laid in mortar; the walls for the basement story all round being three and a half feet thick, and from thence up to the gables two and a half; these gables being of brick, the whole covered with shingle roof, which projects over the building by a very heavy jet, giving to it a very imposing, tasteful, and substantial appearance.

In the main center is the battery room 48x47 feet, affording space for four batteries of five stamps each, the mortar bed of which is formed of huge timbers fourteen feet long, set on end, and resting on a solid granite foundation. In a division of this room is to be placed the engine of sixty-five horse-power, intended to propel the battery, amalgamators, etc., etc. Here is also placed, in a convenient position for charge and discharge, the dry-kiln, through which the ore has to pass as it comes from the mine, preparatory to being crushed dry—this being the method adopted here, in preference to wet crushing.

On the west of the latter room, is the roasting department, a spacious building of 72x50 feet, with four plendid reverberatory furnaces, 11x15 feet each, built on the most approved plan. The grade at which they are set being such as to allow of the ore being run from the battery by car or rail track, right over a funnel set to each furnace, into which it is dropped, and from whence it is fed by a slide into the furnace as required. The same facility is secured in the conveyance and charging of the roasted ore from the furnace room to the amalgamators, which are twelve in number, placed in a room 48x46 feet, with all the appliances necessary for the introduction of steam and water as it may be desired into the pans, which are of the Varney pattern. In this department and contiguous to the amalgamators, are the separators, which are also of the Varney pattern. There is to be an assay office, retorting furnace, and laboratory connected with this mill, the plan of which I have neglected to note down. Eastward of the center building is another or third wing of this structure, divided into boiler and fuel room. The boiler is a forty-eight inch shell, twenty feet long, and has been tested in San Francisco by a pressure of 240 pounds to the inch.

The dry-kiln is heated by the escaping flame from the roasters passing directly underneath it, thus costing nothing for fuel. Surmounting the whole and placed on the main or center building, is a cupola, of octagon shape, eleven feet high, with balustrade at top, affording promenade space for quite a number of persons at once—the whole very appropriately terminating with a forty-foot flag-pole, from which gaily wafts that glorious emblem of Liberty, "the "Stars and Stripes." To all this the company have added an office built of brick, placed midway between their mine and mill, a very extensive building divided into several apartments, all finished in a tasteful and substantial manner. My object in dwelling at such length on this mine and mill, is merely the better to show what is being done here by way of improvement, how it is done and after what fashion. And, believing I could in no better way give your readers an opportunity of judging, than by selecting one of the first class mills now building and endeavor to describe it, as I have attempted to do, in detail.

The cost of this mill has been $125,000, which, added to outlay on mining machinery and office, brings it up to about $175,000, paid out in coin, besides the several thousands invested in purchase of ledges; and all this imported capital, expended here in substantial improvements, which must lead any one to the conclusion that this country is bound to advance, just as soon as appliances, such as those above described, are properly brought to bear on the material which lies within herself to do so. The distribution of these vast amounts amongst the artisans and mechanics cannot fail of itself to produce a marked improvement in this place.

The entire plans, system, and order, of the Confidence Company's works, bear the mark of the taste, style, and astuteness, as well as business tact and energy, of the general superintendent, Mr. W. H. Fearing, who has by an honorable course in all his dealings, as well as affability of manner, gained the respect and good will of all to whom he has become known. Mr. Fearing, as also one of his partners, Mr. B. C. Hill, are at present on their way eastward, on business connected with their mines. During their absence, which will be but short, Mr. C. Boydin fills the place of Mr. Fearing. Only let enough of such material as compose the Confidence Company take the place of the "know-nothing," "do-nothing" class, then you will see the *bricks* come out.

J. R. M.

[Written for the Mining and Scientific Press.]

Notes of a Trip to the Mines of Lower California and Arizona.

OUTWARD BOUND.

Leaving San Francisco on the staunch steamer Pacific, Captain Butters, with a goodly number of passengers, on a Saturday morning, we had a delightful voyage to San Pedro, the ocean being as smooth as a small lake, and we can truly say that we never had a more pleasant trip upon any water, either salt or fresh.

On Sunday, at 10 A. M., put ashore some passengers that were bound for San Luis Obispo and the Warm Springs. There is no dock at this point, landing being made in small boats. As we were making this harbor, we passed the U. S. steamer Shubrick, with Drs. Torrey and Jackson on board, who had been examining the lower coast with regard to its oleaginous productions. After a short delay, we were out at sea again; and at 8.30 P. M. made the harbor of Santa Barbara, and here passengers and freight are landed in small boats. I understand that a fine dock is to be built at that point, which is needed very much, as there is a very large trade springing up, all, or nearly all, the result of oil being found in the vicinity. We made a short visit to the town, situated about two miles from the shore; but midnight found us again on board, and we were told that at 4 A. M. of Monday we were on our way, and at 4.30 P. M. of the same day we were in the harbor of San Pedro, and were taken thence by Gen. Banning's little steamer Clara, to Wilmington, a distance of five miles. This is the point from which troops are sent into Arizona and the adjacent country, the Government having here large buildings, containing supplies for fitting out expeditions. The next morning rode by stage to Los Angeles, a distance of eighteen miles, over a level country, with here and there a hill. There was no verdure to please the eye, but all around were evidences of the drought of two years ago.

LOS ANGELES.

Los Angeles, of which we have thought of by day and dreamed of by night, occasioned by the following description by Hittell, in his "Resources of California," was at last reached. Hittell says: "The general impression upon my mind, after spending the last week in September in the place, is, that it is one of the most pleasant places in the world, known to me, to visit. The luxuriant vegetation, with its semi-tropical character, is peculiarly agreeable to the sons of the North. The 'clime of the sun,' 'the land of the cypress and myrtle,' 'where the citron blooms and the golden oranges glow amidst the dark green leaves, have ever been with the poets of the colder lands the symbols of a terrestrial paradise, and some of the most brilliant verses of Goethe and Byron have been inspired by admiration of them. The song of Mignon came vividly before me as I walked through the gardens of the City of the Angels. Luscious fruits, of many species and unnumbered varieties, loaded the trees. Gentle breezes came through the bowers. The water rippled musically through the *zanjas*. Delicious odors came from all the most fragrant flowers of the temperate zone."

Julius Frobel speaks thus of Los Angeles in his book, "Aus Amerika:" "I could wish no better home for myself and my friends than such a one as noble, sensible men could here make for themselves. Nature has preserved here, in its working and phenomena, that medium between too much and too little, which was one of the great conditions of high civilization in the classic regions of ancient times. Indeed, when we seek in other lands for places like Los Angeles and Southern California generally, we must turn our eyes to the levant. In the United States there are no kindred spots."

Los Angeles is a town of between three and four thousand inhabitants, a large proportion being Spanish. Much of the business of the place has recently been taken away by Wilmington, but still it is a busy, though not thriving, town. Its vineyards are the pride of all the inhabitants, and well may they look with pleasure upon them. We had the pleasure of visiting some of them, among which were Koover's, Wolfskill's, and Sainsevain's. In these were to be seen nearly all the fruits of the tropical climate—oranges, lemons, pomegranates, grapes, figs, limes, citrons, English walnuts, with our own fruits. In one vineyard were 55,000 grape vines and 2,000 orange trees. On every side, and as far as the eye could reach, were to be seen vines and trees heavily laden with fruit.

The climate is delightful; warm during the day, yet not oppressive, with cool and balmy air in the evening. An old inhabitant told us that this is the first time he has ever known frost in thirty-six years, and never knew it to rain in July till this year. Wines are made here in great quantities, and of the best quality. When one visits the vineyards, the first thing done by the proprietor is to set before him his best wine; then he is ready to show you his cellars, vines and trees. We had the pleasure of tasting the richness of the wines of Messrs. Koover, Mateo Keller and Sainsevain, which will vie in excellence with those of Europe. In fact, some of them have been seized at New York as foreign wines, and held till affidavits could be obtained from here to prove that they were native wines. We fancy that soon we shall send wines to the old world in return for all sent us in years past.

THE OIL FEVER

Has affected the citizens of Los Angeles, for many of them are interested in oil wells that are being sunk near there, and they expect soon to "strike ile." There are said to be good silver leads in the vicinity, but we did not have the time to visit them. At this point we obtained an ambulance, drawn by four mules and a saddle horse. Our party consisted of five, including the driver. Having all our provisions for the trip, we felt quite independent, and thought we should have a grand time cooking our meals; but before the end of our journey, all were willing to have meals cooked for us.

LEAVING LOS ANGELES,

We passed in sight of many fine vineyards. The first noticeable thing was the San Gabriel Mission, which, at a distance, looked like a fine building; but we were told that here, as in many other cases, "distance lends enchantment to the view." What interested us most was a fence from ten to fifteen feet high, and in many places as thick, of cactus, known as the Pitahuya (*cereus giganteus*), on some of which were flowers; but it was loaded with fruit, some being ripe, and was being gathered by Indians. The fruit is of the size of a hen's egg, with a red pulp full of little seeds. We had tried to eat of it, but having tortured ourselves with the little sharp points that grow upon the skin, did not care to repeat the experiment, and besides it is not very palatable. When dried, as the Indians are accustomed to treat it, it is said to resemble the taste of dried figs.

[To be Continued.]

A LEEDS (England) paper says: "Recently, Miss Eliza Smith, daughter of Mr. Smith, veterinary surgeon, died under the following singular circumstances. She was in the kitchen with her sister and Mr. Braithwaite, a butcher; the latter was killing a brace of ducks, and as soon as Miss Smith saw the blood running from one of the birds, she became very sick, and was removed to a sofa, where she died almost immediately afterwards. Death is supposed to have resulted from a shock to the nervous system."

CHARCOAL put to the roots of dahlias, and other flowering plants, will redden them vividly; flowers nearly white being thus turned to a deep red, sometimes altogether, and sometimes mixed with the lighter hue in half a dozen varieties, from one and the same root.

ROACH'S SURVEYORS' TRANSIT.

This transit, made and exhibited at the recent Fair by Mr. John Roach, of this city, is entirely the product of California. The lenses of the telescope were ground by Mr. Roach's own hands—a branch of his business which he practised many years in New York, where he was celebrated as a manufacturer of daguerreotype apparatus, and was the maker of the first lens for the production of daguerreotype pictures for Prof. Morse, now of telegraph notoriety, and Prof. Draper, of the New York University.

The castings for this instrument were made by Wm. T. Garrett, of this city. The pattern and design have peculiarities. Mr. Roach's long experience has taught him that when an accident happens, by fall or otherwise, some particular part generally receives the shock or damage, and as a general rule, this is one or both of the centers. If one center only is injured, it is considered that the instrument is repairable; but when both are bent or injured, it is said that "that instrument is only fit for the old brass box," and such parts as can be used for repairs are made available. With this experience, and many years of practical daily observation, Mr. Roach has changed, modified, and strengthened the parts that suffer most from accidents which render valuable instruments useless. The wooden tripod which supports the transit is held by bolts, which press the "bibles" against the legs, often cutting them as they are spread out, and at the same time drawing the screws and straining the plate to which the "bibles" are fastened, causing an unsteadiness in this part, frequently attributed to other parts of the instrument, and "moving" from the object. The new connection is by a stout brass tongue entering between the legs, which the elasticity of the wood binds firmly by the pressure of the bolts, and makes at once a fine support, on which the instrument rests, thus remedying the defects above described.

This transit has double parallel plates; the screws have broad milled-edged heads. The plate in which they screw is heavy and solid, having an annular ring instead of the thimble sockets. The stem projecting below the plate, as well as the stem above, is all in one piece, which gives solidity, whereas in other instruments, as heretofore constructed, this part is composed of three pieces. The socket moving on this—the main center—is also heavy, and is screwed to the lower limb, which has a dish-like form, thus giving it the strength of the arch. The upper plate overlaps the lower limb, its center passing through about one and a half inches into a socket, where it fastens with a screw and washer. This arrangement enables the engineer in the field to clean the instrument without disturbing any of the adjustments. The graduation in half degrees is all on silver, which, with the vernier, reads to single minutes. The graduation of the vertical arc, which is a complete circle, is also in silver. We would invite engineers to examine this instrument.

SALE OF THE MURPHY MINE.—The Murphy mine, at Twin River, Nevada, has been sold and possession given to the purchaser, Mr. A. W. Canfield. The consideration was $50,000 in gold coin, and one-fifth of the capital stock (unassessable forever) of the company incorporated under the laws of New York, with a paid capital of $300,000. A twenty stamp mill is to be erected immediately, and a large force of workmen will be employed on the mine and in opening a road. Captain Shears, late of the Lake Superior copper region, and a miner of long experience, is to be the Superintendent of the company. Out of seventy-five tons of ore taken from the mine, sixty tons were worked at the Butte mill, and yielded nearly $10,000, or an average of $165 per ton. The above facts we glean from the Reese River *Reveille*.

NEW INVENTION.—The Chicago *Journal* understands that an invention has been made by a citizen of that city that will work a revolution in steam engines. It does away with steam boilers altogether, the propelling agent being generated by a shower bath falling on hot iron plates, and passing directly into the cylinder of the engine.

Mining Summary.

Notwithstanding the present depressed condition of the Mining Stock Market, the receipts of bullion from the interior show that the mines themselves are in as flourishing a condition as at any previous time. For the last two weeks they have exceeded $2,100,000. Large numbers of new quartz mills are being put up in all parts of this State and in Nevada.

In our own state the mines are still yielding as well as ever. The discovery of the rich mines in the Excelsior district, in the upper portion of Nevada County, has given a new impetus to mining in the higher regions of the Sierra, which have hitherto been considered quite out of the range of mining operations. A rich discovery has just been reported near Forbestown, Butte County, by several persons who have taken out about a ton of rock which they think will pay fully $10,000, and from which, as they inform the editor of the Marysville *Appeal*, they are actually taking out about $1,000 per day with hand mortars. The ledge has been opened only twelve feet in depth and varies from ten inches to two feet in thickness.

Partial returns were recently received from the first installment of ten tons of rock from the Enterprise lead, Excelsior, now being worked at the Mariposa Mill in Virginia City. The yield of the ten tons was, in gold, $918.58, and in silver, $101.49; total, $1,020.07. The tailings assay $31.42. Total returns, exclusive of the tailings, will soon be given, when we will be able to speak more fully and satisfactorily in regard to the matter. What has already been obtained from the ore shows that it pays by mill process over $100 per ton. According to the *Enterprise*, the ore worked was for the purpose of obtaining a fair and reliable test of the ore of the mine, and what was considered fair average rock. The lead is found to be one of immense size, being by actual measurement thirty-five feet in width, with indications of becoming still wider. Should the ore in the vein pay no more than $30 per ton, it would still be a fortune for all owning in the mine. The stockholders are in high spirits over their prospects, as they well may be.

It is said that $100 per share have been offered and refused for Jefferson stock, in Brown's Valley; and that Sweet Vengeance is selling for $15. Jefferson is said to be held at $200. A correspondent of the *Appeal* says that the probable future monthly income of each of the three principal shareholders of the Jefferson Company (Messrs. Videau, Booth and Snyder), will be from $6,000 to $8,000.

The mines at Goodyears' Bar, Sierra County, according to the *Mountain Messenger* present a lively appearance, reminding one of earlier times and good pay. The large flume is done and two companies are at work, while some half dozen more are fixing up as rapidly as possible. In a few weeks we may look for something handsome in the way of shipments of gold dust.

The same paper says that the New Orleans mining company, at Little Grizzly, are now running in gravel which prospects remarkably well, getting better as they go on, and which very much resembles that of Monte Cristo, on which the lead lies.

We learn from the Calaveras *Chronicle* that quartz mines at Angel's Camp are changing hands, and that the new proprietors, having capital at their command, will be able to give the lead on which the principal claims are located, a thorough test. The mine known as the Winters' mine, has changed owners, and Bovie, of San Francisco, is the present proprietor of one-half of it. This mine is one of the best on the lead, and has always paid well for the labor and capital expended. One ton of rock that was crushed a few weeks since, yielded the snug little sum of seventeen hundred dollars. This rock was selected, of course, but is not superior to much taken from this mine. The process of working is dry crushing and working by the arastra. The mine of Stickles & Co., which is located almost within the town, has also been a paying mine, and promises to be as good as any on the lead. The proprietors are now erecting a new mill, and will have it ready to commence crushing rock in a few weeks.

WASHOE.

The Alpha Company cleaned up their new mill for the second run of six days, on the 6th instant, with the following result: 13,000 ounces retorted amalgam, worth $1.80 per ounce. There is now being taken from the mine, daily, fifty tons of first-class ore, worth $80 per ton; and twenty-one tons second-class, worth $45 per ton. On the 5th inst. this company received the returns of a lot of sacked ore sent to Dall & Schamp's reduction works, at Washoe, which went $512.50 to the ton.

A fine body of excellent ore, the extent of which is unknown, has been struck in the lower level of the Confidence mine, over six hundred feet from the surface. Mr. Nelson, the Superintendent, thinks this new deposit will go as high as $500 to the ton. A large amount of very good looking rock is now being taken out of this mine.

The Bowers' Segregated, which is 100 feet of the original Minerva ground, is considered one of the good claims of Gold Hill. A shaft is now being sunk on the west side of the ravine, opposite the claim, for the purpose of working it.

The Belcher Company have got their new pump finished. It is of ten inches diameter, and will be very effective in removing the water from the mine. They have been hoisting the water heretofore by means of a tub. Large quantities of rock are being taken out for milling, and the mine is in a highly prosperous state.

The works of the Empire are being thoroughly repaired and rendered safer than before. The boiler is being put in first rate condition.

According to the Gold Hill *News*, the Imperial Consolidated Mining Company, whose office is in Gold Hill, has received half a ton of their argentiferous galena ore, which is to be worked *by a new process*, in order to separate the silver from the galena. It is to be worked at the French mill in Gold Hill.

The Virginia *Enterprise* says the Cole Gold and Silver Mining Company have lately struck a large amount of water. They are now selling to the Gold Hill and Virginia Water Company fully ten inches of excellent water. They are still some distance from their lead, but are going ahead at the rate of forty feet per week with the tunnel.

The Yellow Jacket Company have bought the fine 80-horse power Corliss engine, formerly used in the Best & Belcher hoisting works, the latter company having no longer use for the engine, as they are now working their mine through the Gould & Curry.

HUMBOLDT.

We append the following items from the *Register*:

Weber's mill, in Trinity, is crushing Montezuma ore. Webber will move down to the river, this fall, so as to be more advantageously situated for working the Arabin ores.

The following statement is furnished by Mr. Worden of the results from working several lots of ore from the Monroe Series, in Sierra district. These ledges are auriferous. The figures stand as follows: 1,200 lbs. unassorted, worked by hand, netted $229.34; 500 lbs. assorted rock, same process, netted $102.07; 3,000 lbs. poor rock, worked by mill process $116.94; 13,962 lbs. 200 per cent. better rock, mill process, $506.57, and 1,475 lbs. unassorted rock, worked by hand, netted $274.33.

The Ætna Company's mill is about ready to commence crushing. Two men in seven days have taken out about sixty tons of ore, which has every appearance of being rich.

Mr. Nason has secured two mill sites on the river—one for the mill now there, for working Bullion rock, and the other for the location of a mill to work Arabia ores.

THE NATURE OF DIAMONDS.—Professor Gœppert's long-expected prize essay *On the Vegetable Nature of Diamonds* has recently been published, illustrated by colored plates. Experiments show that diamonds cannot be produced by Plutonic agency, as they become black when subjected to a high degree of temperature. That they are, on the contrary, of Neptunian origin, and were at one time in a soft condition, is proved not only by the impressions of grains of sand and crystals on the surface of some of them, but also by the enclosures of certain foreign bodies, such as other crystals, germinating fungi, and even vegetable structure of a higher organization. If Professor Gœppert's conclusions he accepted, confirming and extending as they do the views held by Newton, Brewster and Liebig, diamonds seem to be the final product of the chemical decomposition of vegetable substances. *Athenæum.*

THE Providence *Press* says: "There is a man of our acquaintance living in this city who has been married thirty-four years, and has still his wedding suit, which he has worn every Sunday since, and it is still in good condition for Sunday wear. He has worn it in all 1,768 days."

ENLARGED.—The Red Bluff *Independent* has been enlarged nearly double its former size, and is otherwise greatly improved.

POPULAR JOURNALS.—Under the above head, the *Dramatic Chronicle*, published in San Francisco, has the following:

Every journal of course wants to be popular, because all journals are published as business enterprises, and popularity is generally an essential element of success. But there are two kinds of popularity, which are reached by quite different paths. The one is a present ephemeral popularity, which may be won by truckling to the popular feeling of the hour, and by a time-serving, timid, cringing course generally; by taking care to offend no one who is rich or influential, to express no opinions until they have become recognized or fashionable, by sacrificing convictions for an advertisement, and suppressing wholesome truth for fear of offending a subscriber. The other is an enduring popularity, which brings with it not only prosperity, but influence and power for good; and it is only to be gained by a fair, conscientious, considerate, and independent course by speaking of friends and foes alike with justice and candor; by so eschewing the influence of prejudice and personal feeling that the community shall learn to respect and confide in the statements and opinions published. The former is the policy for journals designed to last for a month, or a year, the latter for those that aspire to a long, healthly, and honorable career.

TOBACCO SMOKING.—It is not one of the pleasant signs of the times that this practice has become in use among boys who have scarcely passed beyond their school days; and so numerous are the instances in which small boys may be seen without any seeming shame smoking pipes in the open street, that it is often difficult to resist the inclination to administer a little seasonable correction. The use of the tobacco pipe before the bodily functions have been developed stops and dwarfs the growth. It leads to idleness, and is in far too many instances a sort of connecting link with dishonesty and habits of drinking. In these days we need to increase the intellectual and bodily strength of our youth; we therefore beg of the masters of schools, of the fathers, mothers, and others who have charge of boys, to have no hesitation about the matter, but to put out the pipes of the small boys at once.—*Builder.*

HOW RED HAIR FOR LADIES IS OBTAINED IN PARIS.—It is the fashion in Paris to have the hair the color of the Empress'. How the brunettes accomplish this is thus explained: At the appointed hour the candidate for golden honors enters the dressing-room in a long white dressing gown. Her hair floats loosely over her shoulders. The artist begins by separating every hair. Then he pours over the head a phial of "water" (probably a deadly poison.) He saturates each hair. This occupies two hours. After fifteen minutes he soaks the whole hair in ice water. He then kneads the hair with his hands. Again ice water is applied. The "gooses" are moved within a few feet of the hair and it turns red. The whole operation lasts five hours, and leaves the lady with red hair, an intolerable headache, mangled nerves and $80 less in pocket.

PRUDENT ECONOMY REWARDED.—The St. Albans (Vermont) *Daily Messenger* says that a Franklin county boy engaged by the month in a large shipping house in Boston, profiting by the maxim that "a penny saved is a penny clear," carefully extracted the nails from the old boxes which "had served their time." In four weeks he had collected in the course of his business two or three kegs of good nails. His employer noticing the accumulation, after consulting the scales, handed the young man sixteen dollars as the immediate proceeds of his economy, and has honored this invaluable trait, in connection with a sterling character in other respects, by an offer of partnership.

THEY have a novelty in the refreshment line at Vesord, a railway station in France, travelers being provided for about fifty cents, with a basket containing three kinds of meat, a bottle of wine, bread, and dessert. The empty dishes and baskets are left at the next station, to be returned.

THEY kill pigs by steam in Chicago. A great iron claw, with five fingers, hooks out the pigs which are quarrelling in the pen below, and lifts the porkers to a gibbet near by, and then plunges them again into scalding water. By the machine fifty porcines are killed, scalded, scraped, cleaned, split and hung in rows ready for salting, within an hour.

THE coal mine of General Cloes, near Leigs, Belgium, was recently the scene of a dreadful accident. A sudden eruption of water took place in one of the lowest cuttings of the mine, and caused the death of twenty-nine persons, men and women, who were working on the spot.

THERE is a parrot in France which is known to be 65 years old, and is believed to be at least 70.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Dividends, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and Amount and Time of Payment of Dividends.

And in accordance with law and an order of the Board of Trustees, made on the 14th day of August, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the office of the Company, 611 Clay street (Room 8), San Francisco, on the 21 day of October, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. L. KIRBY, Secretary.

Office, 611 Clay street, San Francisco. se16-3w

Bella Vista Gold and Silver Mining Company,

Oacachilas District, Lower California.—San Francisco, September 9th, 1865.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of September, 1865, an assessment of thirty (30) cents per share was levied upon the capital stock of said company, payable on the 10th day of September, 1865, in gold coin of the United States of America, to the Secretary, at the office of the Company, 326 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 14th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 28th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. FULLER, Secretary.

Office, 326 Clay street, San Francisco. se16

Managers of the the Pacific Branch.

A CARD TO QUARTZ MINERS.

A year ago I placed on exhibition at the Mechanics' Fair a machine for reducing and amalgamating ores, embodying an entirely new principle. Having on trial best all competitors, I was awarded diploma "FOR THE BEST REDUCING AMALGAMATOR." Since that time a considerable number have been put to work in the mines. Although not properly matured or perfected, the superiority of their grinding qualities has invariably been acknowledged. But my original plan of using this machine for the double purpose of grinding and amalgamating, has been abandoned—experience having shown that a speed sufficient to accomplish any considerable amount of work at grinding is totally unfit for amalgamating, and that no such combination should be attempted. On the other hand, the great work of thoroughly reducing the ore being accomplished, in one simple machine may be combined the work of amalgamating and separating. The old style of large, flat bottomed tub, with slow-moving mullers, is, according to the verdict of both California and Nevada, the best machine for this purpose that has yet been produced. This mode of working admits of my Grinder being constructed with special reference to its grinding qualities, in which condition it is now offered to the public. Its capacity for work is fully doubled by improvements due to the past year's experience.

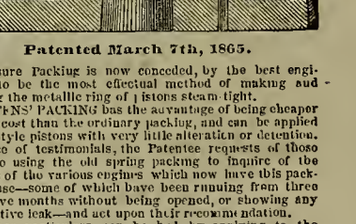
When no greater degree of fineness is required than will pass through the finest punched screen, the work of a battery may be fully trebled by one of these machines placed below it, receiving from a coarse screen in the battery and discharging through a fine one.

An extraordinary amount of work may be accomplished in this way with a great saving of power and first cost of machinery, by the use of this improved Quartz Grinder

J. M. BEATH, Patentee.

Manufactured at Vulcan Iron Works, S. F. 4df

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they an be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

A CHANCE FOR CAPITALISTS.

The Hinckley Quartz Lead,

Located in Jacksm, Amador county, California, containing four hundred feet, is FOR SALE. It has thus far proved to be the richest claim in the county. For further information, enquire on the premises.

Jackson, Sept. 4th, 1865. T. HINCKLEY.

For any further information concerning myself, I will refer (without permission) to A. Hayward, Esq.; Horace Kellum, Esq.; C. W. Rand, U. S. Marshal; Bigelow Bros., Insurance Agents; M. Abrams, Esq. 10v11-4w

Pacific Mail Steamship Co.

The following Steamships will be dispatched on the following named days.

A Baggage Master will be sent through each trip.

Cabin passengers will be berthed for Atlantic steamer.

OLIVER ELDRIDGE, Agent.

Corner Sacramento and Leidesdorff sts.

PLEASURE AND SLEEP.—When William the Fourth was crowned, a gentleman from the country having been seized with a temporary mania to witness the coronation procession, purchased a seat in one of the stands erected in Palace Yard for the occasion, and, fearful lest the crowd should prevent his access to it in the morning, he took possession of it over night. Excited expectation, conspiring with the novelty of his position, kept him thoroughly awake till toward noon next day. He saw the multitude assemble, the military take up their posts, and all the successive changes which indicated the near approach of a gorgeous and solemn ceremonial. But he had drawn too freely upon his physical strength. There is a point of compulsion beyond which nature refuses obedience. The point in this instance was reached a few minutes before the procession started, and when it passed by the stand on which our country gentleman sat, he was locked in the arms of a sleep that could not let him go. The incident fairly illustrates the position we are aiming to establish. There are some things which fly from you the more resolutely they are courted—sleep is one, pleasure is another.

SUPERIOR LIQUORS.—It is claimed that the recent investigations of medical science have demonstrated two facts, which have been promulgated by high professional authority, to wit: First, that alcoholic liquors, free from poisonous adulteration, used with prudence, are nourishing, life-sustaining, and healthful. Second, that in connection with copious inhalation and fatted meats, they arrest pulmonary diseases, by seizing upon and consuming the mucous tissues which destroy the lungs. Our ablest physicians have accepted these statements as facts, and are conforming their practice to the new theory. It will be understood that our approval extends only to PURE liquors, with the expression of a belief that those which are impure—that is to say, manufactured from drugs—will brutalize and destroy life, under all circumstances, with the certainty of strychnine or poison. The good must never be confounded with the bad, however, in judging of liquors or of human character. The use of an article, on the same principles, may prove a benefit, while the abuse is injurious and demoralizing. Pertinent to this subject, Mr. I. D. Thompson has on exhibition at the Fair a case of whiskies and brandies from his sample rooms, 321 Montgomery street—where, as he informs us, he retails ONLY the same meritorious kinds—which might grace the table of king or connoisseur, and receive the stamp of approbation. The brands are all old, and the liquors soft, oily and aromatic. His whiskies are known as the "Hanger," from Virginia; the "Miller" and "Lily," from Kentucky, and "Old Rye," from the Monongahela. The "tasting committee" have pronounced them superb. Those who drink liquors ought to see to it that they get them PURE; and there is a general concurrence of opinion that Mr. Thompson keeps no other kinds. *

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyritous, and the (so-called) "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. F. KIMBALL, J. R. MURPHY.

10v10

NOTICE

—TO—

COPPER MINING COMPANIES.

MARTIN & CO.,

Office, Stevenson House,

Corner California and Montgomery streets (up stairs).

WILL CONTRACT FOR THE

PURCHASE OF COPPER ORES,

Assaying eight per cent. and upwards of Copper to be on.

We will make advances upon Ores of Copper.

San Francisco, Post Office Box 1259. 22v10

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with CALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Model on exhibition at foot of stairs in the Pavilion. Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m

THE PACIFIC COD FISHERIES.—The cod fisheries of the Ochotsk Sea become more and more promising, as an element contributing to our prosperity, as the capital and enterprise invested in it swells in volume. Two years ago a single vessel wandered off to the then unknown banks, on an uncertain adventure, and, in a round voyage of three months, brought in a cargo of codfish, which opened the eyes of some of our incredulous merchants. Encouraged by the results of this first experiment, the same parties fitted out a second expedition, consisting of two small vessels, and the enterprise was again crowned with the most gratifying success. This was the small beginning of what is rapidly growing into an important trade. Eight hundred quintals of codfish, direct from the Ochotsk Sea, were landed at Clay street wharf, on Tuesday last, for J. G. Marks & Co. Thus we see new resources constantly developing, as the result of the spirit of enterprise and adventure that pervades our people.

THE Cole Tunnel has pierced the base of Mount Davidson, Nevada, for a distance of 1,157 feet.

SAN JOSE INSTITUTE

—AND—

COMMERCIAL COLLEGE,

LOCATED AT SAN JOSE, CAL.

MALE AND FEMALE.

The next session of this institution will commence on

Monday, July 31, 1865.

An experienced and competent BOARD OF INSTRUCTION is engaged, and every facility will be afforded for a thorough course of study, both in the Academic and Commercial Departments.

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Ry. Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Fine, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Yeager's tubs, Prater's concentrators, Wahlee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron Frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices.

21v10 H. J. BOOTH & CO.

MINERS' FOUNDRY

—AND—

MACHINE WORKS,

First St., between Howard and Folsom Streets,

SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,

Machinery, Mining Pumps, Amalgamators,

Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.

All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

HOWLAND, ANGEL & KING.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Emilia Mining Company, State of Guerrero, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of August, 1865, an assessment of twenty-five cents per share was levied upon the assessable stock of said company, payable on the 17th day of August, 1865, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 55 Montgomery Block, in the city and county of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 30th day of September, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. CUNNINGHAM, Secretary.

Office, No. 55 Montgomery Block, southeast corner of Montgomery and Washington streets. Office hours, 10 A. M. to 3 P. M.

San Francisco, August 16, 1865. au19

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Saturday, September 23d, 1865, and the sale thereof until Saturday, October 7th, 1865. By order of the Board of Trustees.

se16 T. B. CUNNINGHAM, Secretary.

Good Hope Gold and Silver Mining Company, Alpine District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of September, 1865, an assessment (No. 9) of fifty cents per share was levied upon the capital stock of said company, payable on or before the 9th day of October, 1865, in United States gold and silver coin, to the Secretary, at his office, 526 Montgomery street, San Francisco, or to H. MORRIS, at Markleeville. [*Delinquents will be held for accruing costs after the 9th of October.*]

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale, By order of the Board of Trustees.

PRESTON MORRIS, Secretary.

Office, 526 Montgomery street, San Francisco. se16

Kimblin Ravine Company, Sierra County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 12th day of August, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
J Bandmann (owned by A Menle)	not issued	4	$100 00

Office, 402 Front street, San Francisco. se9

Jewett Gold and Silver Mining Company, Gold Hill District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2d day of September, 1865, an assessment of nine ($1) dollar per share was levied upon the assessable capital stock of said company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Thursday, the 4th day of October, 1865, will be advertised as delinquent, and unless payment shall be made before, will be sold on Saturday, the 21st day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. M BURNHAM, Secretary pro tem.

Office, 509 Clay street, San Francisco. se9

La Favorita Mining Company, Moctezoma District, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 3d day of August, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable on the 31st day of August, 1865, in United States gold coin, to the Secretary, 429 Sacramento street, San Francisco, Cal.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 30th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. WASSERMAN, Secretary.

Office, 429 Sacramento street, San Francisco. se2

Southern Light Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

All persons are hereby cautioned not to purchase the following described stock, sold for delinquent assessment No. 6 September 6th, 1865, as said stock will not be transferred on the books of the Company, viz:

No.	Shares.	In name of	Shares taken.
51	7½	James H Hardy	2½
69	0½	George Work	4½

San Francisco, Sept. 8th, 1865.

E. J. DRINKHOUSE, Secretary.

Office, 228 Front street, San Francisco, Cal. se9 2w

Porter Gold and Silver Mining Company, Virginia District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of July, 1865, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 534 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 30th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of October, 1865, to pay the delinquent assesment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. W. WESTON, Secretary.

Office, 534 Clay street, San Francisco. jy22

This assessment is re-advertised on account of omission to advertise the delinquent list at the proper time. By order of the Board of Trustees.

C. W. WESTON, Secretary.

San Francisco, September 1, 1865. se2

Scott Mining and Exploring Company, Humboldt county, State of Nevada.

NOTICE.—There are delinquent, upon the following described Stock, on account of Assessment levied on the 5th day of August, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E A Scott	10	300	$240 00
E A Scott	11	200	160 00

au12-4w J. WARREN CLARK, Secretary.

Santa Cruz Petroleum Oil Works Company—Location: Santa Cruz county, California.

The third Annual Meeting of the stockholders of the above Company will be held at their office, 415 Montgomery street, San Francisco, California, on Tuesday, the 26th day of September, 1865, at 8 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year and such other business as may properly come before it.

LEANDER RANSOM, President.

R. WEGENER, Secretary.

N. B.—All stockholders who cannot be present are earnestly requested to file their proxies with the Secretary au12

St. Clair Consolidated Silver Mining Company Smoky Valley District, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 31st day of July, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares	Amount.
W Beck	39 40	200	$100 00
James Phelan	48	200	100 00
J D Boyd	45	200	100 00

And in accordance with law, and an order of the Board of Trustees, made on the 1st day of September, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction at the salesroom of Edwards, Olney & Co., No. 626 Montgomery street, San Francisco, on the 16th day of September, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

AUG. KUNAST, Secretary.

Office, 540 Washington street, San Francisco. se2-3w

Table Mountain Copper Mining Company, Stanislaus District, Calaveras county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of August, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, in San Francisco, or to J. M. PIKE, Superintendent, at Copperopolis.

Any stock upon which said assessment shall remain unpaid on Friday, the 22d day of September, 1865, will be advertised on Saturday, the 23d day of September, 1865, as delinquent, and unless payment shall be made before, will be sold on Thursday, the 12th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, 436 Jackson street, San Francisco, Cal. se9

Tip Top Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on Monday, September 18th, 1865, at 12 M. of said day.

au12-4w J. WARREN CLARK, Secretary.

Taurus Mining Company, Santa Fe Mining District, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 29th day of August, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 30th day of September, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. H. BURTON, Secretary.

Office, Room 4, northwest corner Clay and Front streets, San Francisco, Cal. se2

Wisconsin Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

The Annual Meeting of the stockholders will be held at the office of the Company, No. 410 Montgomery street, San Francisco, on September 17th (Sunday) changed to Monday, September 18th, 1865, at 10 A. M. of said day.

au12-4w J. WARREN CLARK, Secretary.

Yankee Blade Tunnel Company, Reese River District, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 4th day of September, 1865, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable on the 6th day of September, 1865, in United States gold and silver coin, to the Secretary, at his office, 305 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 7th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 27th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.

Office, 305 Montgomery street, San Francisco. se9

BEAUTIFUL EXTRACT.—The following is from the Wisconsin *Farmer*: "Not to the majority of men who we are satisfied think that soil is nothing but dirt, but to the chemist, who knows its origin, its nature, and its capabilities, it is a wonderful mixture of three beautiful elements, which in their ever-varying forms become the ambient air, the liquid ocean, the precious opal, the amethyst, and the still more precious diamond; or delicate blue bell and violet, the amarath, the lily, and the rose, the spear of blue grass and the cedar of Lebanon; or again, the ruby lip, the love-lit eye, the noble palpitating heart, and more wonderful brain. These are the jewels of which the soil is composed, and out of which the husbandman strives to force the food hunger claims. Henceforth, as he turns the furrow of his field, let the sleep of his thought be broken by the reflection that the earth thus stirred up by his ploughshare is doubtless composed of his ancestral heroes, whose deeds are the history of the past, and whose mortal remains are the plastic material out of which are building the bodies of men to day."

SILICATE OF METHYL AND SILICIAN METHYL.—Friedal and Crafts have announced to the Paris Chemical Society that they have succeeded in forming silicate of methyl by the action of perfectly pure and dry wood spirit on chloride of silicium. By heating together zinc methyl and chloride of silicium they obtained silicium methyl.

MINING LAWS AND FORMS.

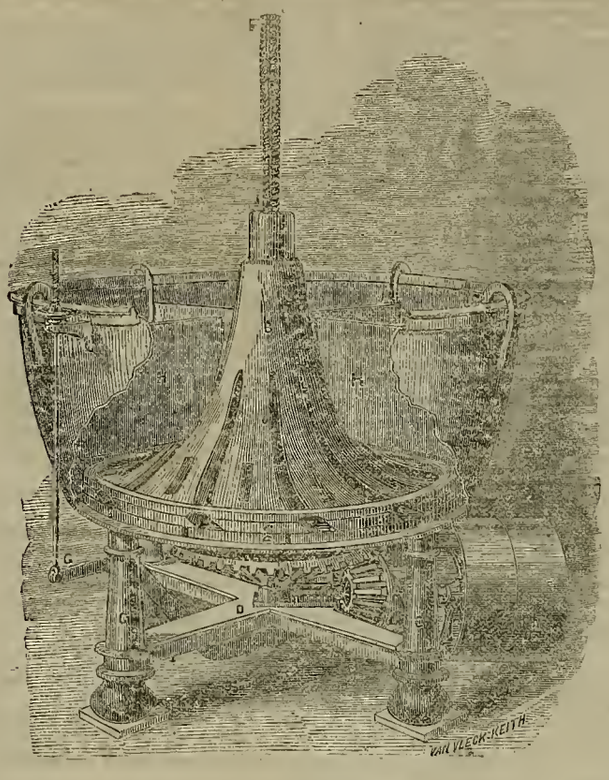
OFFICE—Room No. 10 Government House, corner of Sansome and Washington Sts., San Francisco.

The claims of this Company consists of SIX HUNDRED AND FORTY (640) ACRES, situated on Kellog Creek, in the Marsh Brook Mining District, Contra Costa county, Cal.

One thousand (1,000) shares of the contingent fund is offered at the low price of ONE ($1.00) DOLLAR per share, full paid, all the stock being unassessable. All who wish to purchase, or make any enquiry concerning the Company, will please call on the Secretary,

J. M. BUFFINGTON,

2v11 Corner of Sansome and Washington streets.



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

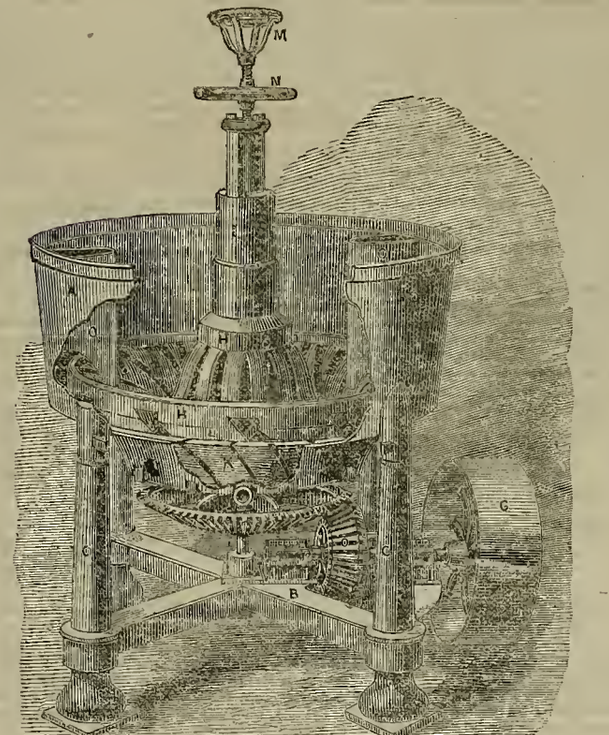
Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.



THE WHEELER & RANDALL Grinder and Amalgamator

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

Machinery.

ATTENTION, MINERS!
LINSCOTT'S PATENT
CHAMBER DRILL.
Great Improving in Blasting.
W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ⅛ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 9th, 1864. HEPBURN & PETERSON.

nov8 3m*

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to inspire persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

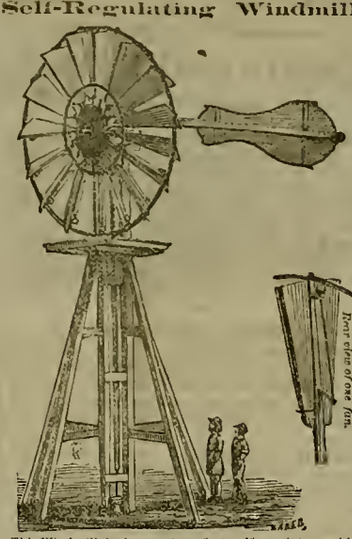
ATWOOD'S
Self-Regulating Windmill.



This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at
222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.
222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS
Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power
Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.
ALL WORK WARRANTED.
☞ For further Particulars see small circulars. ☜

Equal to the Best Overshot Wheel
POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE.

The DOUBLE TURBINES, so long expected, have arrived at last, and orders can now be filled. We have a large supply of the different sizes, from 20 inches to 72½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

The above Wheel will be exhibited during the Fair of the Mechanics' Institute, where all may see it and hear its merits explained. This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds will yield from 10 to 40 horse-power under a head of 25 or 50 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to
LEFFEL & MYERS,
4vll-tf Care Richards & McCroken, San Francisco.

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steel, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to
PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S
Separator & Amalgamator

is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to rework their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Flume Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

HANSCOM'S CRUSHERS,
Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Orinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water or Steam Power. For further information address W. W. HANSCOM.
1 Golden State Iron Works, San Francisco.

RAILROAD IRON MANUFACTURE.—One of the largest and finest rolling mills in the United States is already in operation in Chattanooga, Tenn., which is daily turning out the best quality of railroad iron. A blast furnace is in contemplation, and a copper rolling mill of $1,000,000 capital is soon to be put up in the neighborhood. A large blast furnace will be commenced in the Fall on the Tennessee river above Chattanooga. Several coal companies are only waiting for machinery to commence operations in different localities around the place. The old coal mines are being reworked and new ones opened.

THE proceeds of the sale of confiscated cotton already paid into the treasury at New York, amount to over $4,000,000.

As the moon, whether visible or invisible, has power over the tides of the ocean, so the faces of the loved ones, whether present or absent, control the tide of the soul.

Away with Spectacles.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

These suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

NOTES OF A LECTURE ON GEOLOGY.

GIVEN AT THE LINCOLN SCHOOL HOUSE, SAN FRANCISCO, BY DR. C. T. JACKSON.

The closing exercises of the session at the Lincoln School, took place on Friday of last week; and to add interest to the occasion, Dr. C. T. Jackson, who was about to leave for the East, was invited to favor the pupils and such other friends of education as might be present, with a brief lecture on geology. After the conclusion of the usual exercises by the pupils, the Doctor was introduced to the large audience present, by Mr. Pelton, Superintendent of the city schools.

He commenced his remarks by a brief reference to the probable primeval state of matter—of La Place's nebular theory—of the probability that all the planets comprising our system were probably at one time a vast ring of plastic matter, which has since been segregated into planets. He showed that the earth must once have been a molten mass, and that the rocks and soil which we now behold, and which forms a crust over the still molten interior, are but the results of oxydization. The ignition or molten condition of matter was in all probability the result of the first combination or commingling of elements, an occurrence which could not fail of producing a large amount of heat.

He next showed that the earth had in its whole mass a specific gravity of 5. or is five times as heavy as its bulk of water, while the rocks of its crust has a mean specific gravity of only 2.5, or two and a half times as heavy as their bulk of water. From this he inferred that the interior portions of the globe must be of a metallic nature. He next stated that by careful experiments it was found that the temperature of the earth, from the plane of invariable temperature, or from that point where the sun's rays no longer beat the earth rises, as we descend into the interior, in the ratio of one degree for every forty, fifty or sixty feet, varying according to the nature of the rocks in different countries; and if the heat increases 1° in forty feet, at two miles depth, water will boil, and at sixty miles depth, all rocks will melt. From this he finds that the interior of the earth is still incandescent, and would remain so for an immense and almost immeasurable length of time, since the imperfect conduction of the crust prevents the loss of more than a small fraction of a degree of heat per century, as proved by Baron Fourrier. Whether the earth would ultimately cool down so as to become uninhabitable, is an interesting question of science.

He said that interesting experiments on the absorption of water by rocks had been made in France, and that it was stated that since the heat of the interior of the globe kept the water within two miles of its surface, if the whole globe should be cooled down to the freezing point of water, all the oceans, lakes, and rivers, would at once be absorbed by the rocks.

Experiments proved that five times as much water as actually exists on the earth would be taken up by the pores of the rocks, when cooled to 32° Fahrenheit. Therefore the next thing would be the absorption of the entire atmosphere also, and the world would become, like the moon, without air or water, and uninhabitable. It was suggested that this might possibly be the future of this world, and that the moon now looks down on the world as its future barren sister. We do not know, however, but there may be some means in store for the restoration of the escaping heat of the world; but if so, it is not apparent as yet to the eye of science.

We know the temperature of interplanetary space is at least as low as 100° below zero, or at the greatest cold of the polar regions of the earth. Not long since, a great meteoric stone exploded over Dhurmsala, in India, and scattered masses of its substance over the whole of that military department. These were seen to fall red hot on their surface, and a fused enamel or crust gave evidence of the great superficial heat they acquired in falling through the atmosphere; but these stones, picked up immediately after they fell, were, when held for a few moments, so cold as to benumb the hands. This internal cold was that which they brought from interplanetary space, and the thin exterior of so imperfect a conductor was alone melted. It was like the Chinese luxury of ice fried in butter. Those who took the pieces of this meteorite in their hands felt the cold of regions far beyond our atmosphere. The evidence sent by the Governor General of India, establishes the fact of this great cold beyond doubt.

Dr. Jackson next explained, by means of a diagram, the actual positions of the various strata of the globe to the depth of thirteen miles, as ascertained by the geologists of Europe and America. He gave all the different classification which have from time to time been adopted, each from a different stand point; some theoretical as to the origin of the rocks, others with a view to their zoological and botanical relations. He also showed which formations exist west of the Rocky Mountains, and particularly in California and Nevada. He showed the great importance of examining the junctions of rocks of aqueous and of igneous origin, as at these points ores of the metals most abounded.

He spoke of the Jurassic age of the slate rocks, which carry the auriferous quartz veins of California, as exceptional and very remarkable; yet their age was conclusively proved by the occurrence of ammonites and belemnites in Mariposa county. He also showed that granitoid rocks have been thrown up in all geological ages; that they come up as high as the tertiary strata. These recent granites are peculiar, and are not charged with quartz in aggregated crystals, although they contain abundant veins of that mineral often charged with silver ores, as in the Nevada silver districts in and near Austin. Those granites remind one of trachyte—a volcanic or rather plutonic rock. The organic secretion of secondary limestones was also spoken of, and the corals and fossil shells noted. Ancient coral reefs of the Devonian age recalled the sub-oceanic vision of Ladurlad, as given by Southey in his "Coral Grove." The lines were eloquently recited.

Intrusive or plutonic rocks were mentioned, and an account of Pluto's irruption upon Neptune's great dinner to the rocks, was described, by quoting at length, a humorous and highly imaginative poem, written by an Irish bard, and entitled the "Banquet of Neptune," in which the sea-god invited all the different rocks and strata to a dinner served with dishes most congenial to the taste of each. We have given above but a mere outline of the lecture. The most interesting portion of his remarks, to many, was that just previous to the close, in which he referred to the coal formations, and some recent experiments with reference to the origin of coal and other mineral crystalization, which we give at length, in nearly the words of the speaker.

COAL FORMATIONS—COAL IN CALIFORNIA.

1st. The true coal formation lies between the Devonian and new red sandstone series, and is marked by well ascertained fossil plants of tropical genera, such as tree ferns, sigellariæ, with stigmariæ, lepodendræ, and palm-like leaves and stems, and also by the presence of ganoid fishes, paleoniscus, etc.

2d. Bituminous coal of the new red sandstone, and in some localities anthracite coal, are produced by the action of igneous rocks. These coal formations, existing most extensively in North Carolina and Virginia, are marked by the presence of an abundance of zamios, cycas, and other peculiar plants of that formation. Fossil fishes, catoplerus, and other peculiar species of the paleoniscus, are also found. This coal is excellent for making gas and for forge uses, as it cakes and makes a good hollow fire.

3d. Coal of the cretaceous series, or chalk formation. This coal is found at Mt. Diablo, and quite extensively in both California and Nevada. It is a true brown coal, burns with flame and much smoke. The beds at Mt. Diablo are from three to four and a half feet thick, and, so far as known, five in number. The plants of this coal formation have not yet been sufficiently studied; but they are mostly of the exogenous class, a tree that grows by deposition of annual rings of sap-wood next to the bark.

4th. Coal of the tertiary series. This coal abounds in Cheriqui, on the Isthmus of Darien, and is there in the Eocene tertiary, with an abundance of fossil shells of well known forms. The aggregate thickness of these beds of coal is twenty-five feet. It is highly bituminous, and suitable for making illuminating gas of great purity. It is also excellent for steam fuel.

Tertiary coal, analogous to anthracite, is also found in the tertiary rocks of Bellingham Bay, and in various parts of Oregon. It is accompanied by the tertiary shells of the Eocene age. In California there are also some thin beds of coal in the Miocene tertiary; but none of sufficient thickness to be profitably wrought have yet been discovered.

Owing to the non-existence of the usual coal formation here, there was formerly little belief in the existence of any workable beds of coal in California, and it was supposed that the first samples produced were merely local deposits of lignite. Now, however, we know that there are in California regular beds, and probably regular basins of true brown coal in the cretaceous rocks of the Coast Range.

Petroleum also occurs in the tertiary formation, and between it and the subjacent cretaceous rocks.

INTERESTING EXPERIMENTS.

The researches of M. Daubree, of the Garden of Plants of Paris, in France, have not only explained the origin of many crystalized minerals, and most of our metamorphic rocks, but also have chemically proved that the same vegetable matters which, under certain conditions, form bituminous coals, will, under others, which certainly did exist at the epoch of the coal formation, produce well characterized anthracite vegetable matters, decomposing at a moderately warm temperature under water, lose part of their hydrogen and oxygen, in the form of water and light carburetted hydrogen gas, and by this change become, in the course of time and under pressure, bituminous coal. If, however, this vegetable matter is exposed to super-heated water, say at 500° Fah., or at a heat nearly double that of the boiling temperature, it will melt and become perfect anthracite, hard enough to scratch glass. Daubree made his experiments by placing the substances to be operated upon in strong iron tubes, filled entirely with water and closely scaled up with screws and copper washers. These tubes were placed in the brick work of a gas furnace, where the heat was steadily kept at 400° Fah. After a few weeks the tubes were opened, and the nature of the changes which had taken place in the vegetable matters were noted. *Pine wood had melted into black shining globular masses of anthracite coal!*

By the same method of operating, M. Daubree has been able to make crystals of most of our zeolites, and even to convert glassy obsidian into crystalized feldspar. He has thus shown how most of our metamorphic rocks and crystalized minerals could be formed by super-heated water, at a moderate depth from the surface, or beneath the sea.

Some rocks may have been formed by pressure, or by dry heat; but by far the greater number of them were evidently humid at the time they were rendered crystaline; for their crystals are often hydrous—or contain water. This is often found in transparent crystals of quartz. However, the absence of water in crystals would not prove that they were not formed in super-heated water; for M. Daubree has made anhydrous minerals—the feldspar above named being one of that series. There was never, remarked the doctor, a more gigantic step made in chemical geology, than that here noted, and quite recently accomplished by the distinguished French mineralogist and chemist, whose experiments are mentioned above. Specimens of his work were forwarded at the time the experiments were made to Dr. Jackson.

THE MECHANICS' INSTITUTE AWARD OF PREMIUMS.—We give, in the present number a full list (revised by the Executive Committee) of awards to exhibitors at the late Fair of the Mechanics' Institute. This is the only full and complete publication that has been made; all previous publications having abounded in errors, or been incomplete in detail.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Esmeralda and its Mines.

Editors Press :—Notwithstanding the present depressed condition of the mining interests abont this place, the future of Aurora was never more hopeful than to-day. The mistakes of the past are now more fully understood, and the experience gained will be turned to the most profitable account for the future. Mining in and about Aurora will hereafter be conducted on a scale of liberality and with a degree of intelligence which cannot fail to produce most satisfactory results, and which will soon place the mines of this region in the front rank for both productiveness and permanency. I propose, in this letter, to give your readers a brief account of the present condition of some of the most prominent ones, and in so doing will commence with the

REAL DEL MONTE.

This mine having changed very materially in both the quantity and quality of its ores, it was also found necessary to change the management as well. The entire control of the business of the company is now in the hands of Mr. L. B. Hopkins, who, by a thorough system of economy has not only managed to keep the expenses of the mine within its income, but has realized to the company, from May 2d, 1864, to April, 1865, some $60,000 over expenses. The entire property of the Del Monte Company, mill, machinery, etc., is in most excellent condition. Their mill is beyond doubt the finest on this coast, of its capacity. Their mine, though rather narrow in the vein at present, is turning out enough of ore to run their mill about half time; and as to the probability of their meeting ores as extensive and rich as they have formerly done when they get to water line—there is everything in favor of supposing that such will be the case. This fact is now being thoroughly tested by the sinking of perpendicular shafts to a depth of five to six hundred feet. A deep shaft is also being sunk by the Wide West Company, under the superintendence of Mr. Pope. This being the most advanced will be the first to demonstrate whether or not any improvement in the mines of Esmeralda may be looked for beyond the depths heretofore reached. I am satisfied, after a careful examination of all their surroundings, that the mines of this district will again astonish the world—as they once before have done—by the richness of their mineral veins.

How different would be the condition at the present time of these heretofore magnificent mines, had the managers only used the simple precaution of keeping their mine prospected in advance of their drifts, which should have been done by keeping their main shaft or incline, some one or two hundred feet below their working levels. Instead of doing so, they ran all over the veins for the richest ores, carrying their excavations on without the least regard to system or mining engineering, leaving the mine in such condition as to require a large outlay and much risk in putting it in working order or safe condition, which is now being done.

THE MILLS OF ESMERALDA DISTRICT.

I was much surprised at finding so many here, there being no less than twelve—all depending on the ledges of Last Chance Hill, for a supply of ores—but unfortunately nearly every one of them are idle at present, pending the further development of the place.

THE OUTSIDE DISTRICTS

Are numerous, and the proof of their richness, both in gold and silver—the latter abounding most—is not wanting. Foremost amongst these is the Montgomery district. The richness of the ores from this district are too well known to need comment. The leads, it is true, are small, but numerous and valuable. There are two four-stamp mills now being put up there, and two more in contemplation. The distance from here is fifty-five miles, in a southeast direction.

THE BLIND SPRINGS DISTRICT

Is another very rich mining section, fifty miles east of here. The ledges of this place are very large, being from four to twelve feet in thickness. Some of the leading lodes of Blind Springs have been sold to Eastern capitalists, whose attention has been drawn to these mines by that very enterprising gentleman, Mr. Reese, of the firm of Krouse & Reese, assayers of Aurora. These gentlemen are largely interested in this district, as also in almost every well developed project in this part of the country. Being possessed of means, enterprise, and skill, they are foremost in demonstrating the mineral wealth of the country. Under the management of Mr. Reese, smelting works are now being built by this New York Company, as well as a good mill for the treatment of such of the ores as may be adapted to amalgamation. The richer ores of the district—like all rich ores—being better treated by smelting.

COLUMBUS DISTRICT

Lies contiguous to Blind Springs and Montgomery. The ores of this district are so similar to those of the latter, that a description of the one gives the character of the other. Here, too, a mill is now on the way for the reduction of the ores. The ores of these districts, I would here remark, are very different from all others surrounding them—that is, in their combinations with other metals—being what is generally known by the name of silver copper glance, slightly combined with antimony and considerably so with lead and sulphur. These being the only districts, with one exception, on which I feel competent to speak at present, I will now have a word to say of the

BODIE DISTRICT,

Which, though last is not the least of all those surrounding Aurora; being in fact the best mining district in this section of the country, and I may add, in any other section of mining country yet known. The mines of the Bodie district are situated on what is called Bodie Bluff and High Peak Hills; distance from Aurora eleven miles, at an altitude of nine thousand feet above the sea. These hills are a portion of the series of foot-hills of the Sierra Nevada on their eastern side, at a distance of some twenty miles. Bodie is in Mono County, Cal., but quite close to the dividing line of that State from the State of Nevada. From the top of Bodie Bluff and seemingly at your feet, though distant twelve miles, lies Lake Mono—or as it is more appropriately called, the "Dead Sea of the West"—stretching itself for some thirty miles north and south, along the foot of the Sierras, of which latter you can enjoy a never ending view from this elevation. The "White Mountains," too, stand out in bold relief upon the sterile plain before you, which stretches from Walker Lake, at its northern extremity, to the Owen's River Valley south, lifting their chalky crest to bound your view as you look eastward from here.

The mines of Bodie Bluff were discovered by a Frenchman named "Bodie," as early as 1859—by his first discovering placer diggings, which are here very rich even to this day, but cannot be worked to advantage for want of sufficient water. They have been worked for short terms in the spring, when the melting snows would afford sufficient water, and pay from fifteen to twenty-five dollars per day to the hand. Though the quartz ledges were discovered in '59, yet little or no attention was paid to their development until '61, and even then received no further attention beyond location and sufficient working to prove their value and hold them by law. This neglect of such very valuable mines, was owing to the extraordinary excitement then prevailing about those of Esmeralda district. The principal ledges of the district in 1861 and 1862, were taken up by and organized into the following companies; namely: Bodie Bluff Consolidation, Bodie No. 2, Isabella Company, Tioga Company, and Rio Vista Company. During the summer of 1864, a consolidation of the entire interests of these companies took place, forming the present "Empire Gold and Silver Mining Company," with their head office at New York city, where resides a majority of the trustees. The working capital of the company is one million dollars, and with this they have gone to work in the most thorough manner to open out their mines, by running tunnels, sinking shafts, etc., etc. They have been thus at work for the past ten months, and have now three separate tunnels run in, transverse of several of their ledges, to a distance of from 252 to 375 feet, being at a depth from the upper surface of 255 to 300 feet. As the object of the company was not to take out ore so much as to put the mines in a good condition for future operations, they have succeeded so far, that now they can put 200 men immediately to work extracting ore, when, from the fissile nature of the quartz, and the regularity of the thickness of the veins, which are generally wide enough from casing to casing to admit of being worked without breaking through the wall rock, five hundred tons per day might be taken from these ledges.

The business of the Empire Company is under the management of Dr. J. L. Howard, of the firm of Howard & Sanches, bankers at Aurora—as general manager and financial agent. To his credit I must say that it would be well for the country if many of our mining superintendents would come and take a lesson from the system of mining management inaugurated here. Of the value of the ores of these ledges I need not say much, as their character in that particular has been well proven and is generally known.

There has been several hundred tons of the ore from these ledges worked at the Aurora mills, yielding by a rather imperfect method of amalgamation, from forty to fifty dollars per ton; though the assays were as high as one hundred and over.

This company have just completed their first mill. It is situated at the foot of Bodie Bluff and right under the mouth of the tunnels. The distance in perpendicular hight from the mill to the lodes at their outcrop on the Bluff, is 800 feet, affording the finest facility possible for conveying the ore from the mines to the mill. This mill has been planned by Mr. B. O. Cutter, of San Francisco, and built under his immediate supervision. It certainly does credit to him as an architect in this particular line of mill building. Mr. Cutter has planned and built many of the leading mills of the country. In this section of country he built the Fogus mill, the Durand mill, and also the Antelope mill; the latter is not to be excelled by anything I have yet seen. The Empire mill is planned after the Antelope; like it, is built of brick, in the most substantial manner, and so arranged in placing the machinery, as to afford the utmost convenience in its use. This mill has sixteen stamps, eight of Wheeler's pans, three settlers, with shaking tables, and a continuation of riffled sluices—the whole so well adapted to the saving of everything contained in the ore, that I cannot see the least possibility of a failure to work this ore up to ninety per cent. of its assay. The company have a most splendid supply of water taken from adjacent springs. The motive power is a thirty-five horse power engine, a splendid tubular boiler, with all the necessary appendages in the very best order and style; the entire structure is covered with a tin roof.

The first movement of a quartz mill in the Bodie district was made by this one, on the 6th instant, by setting her stamps to work, and on the 13th instant by moving her entire machinery, which now are steadily running, with a fair prospect of continuing to do so for a long time to come.

In my next you shall hear from the result of the workings of the ore in this mill. In view of the fact of this mill not being able to crush one fourth of the ore now coming out of the mines, this company are now preparing to erect another of thirty stamps as soon as spring opens. And the impression is, with the most substantial facts to sustain it, that even then they cannot reduce more than one half of the ore which will be coming out by that time. There are other mines situated on the "Bodie and High Peak Hills," which certainly are equally as noteworthy as any one of the Empire Co.'s lodes. There is the "San Antonio," the "Home Stake," and several others not yet much developed. But the two named are most thoroughly prospected and their value fully established—by having several tons of the ore worked in mills at Aurora. The "Home Stake Company" are now engaged in building a twelve-stamp mill close to their mine, which they expect to have running in about five weeks' time. This mill, and the mine connected, are under the management of Dr. J. L. Howard, who is largely interested in it, and like the business of the Empire Company, is being carried on with the closest regard to a proper application of the means placed at his disposal for the construction of the mill and working of the mine. This company have now at their mine several hundred tons of ore that will certainly work as high, by mill process, as $125 per ton. Mr. B. O. Cutter is also the architect of this mill, when, from what I have seen of the Empire mill, I am satisfied that this one will be but another monument to his fame as a mill architect. That Bodie district is now taking the lead, none can deny, while all admit that to the enterprise and energy of Mr. Howard in bringing about these very desirable improvements, as well as in the better development of the mines of these companies, is due the credit of the great benefit to be derived by the country generally, but by Aurora in particular, from the vast outlay going on, as well as from the large amount of bullion which these mines will turn out from this time forward. Before this reaches you the first shipment of bullion will be made from here. J. R. M.

Aurora, September, 1865.

Precious Stones in North Carolina.—It is reported that precious stones of considerable value have been found in the southwestern part of North Carolina. A lady owning property in that region claims to have in her possession two of the finest opals ever discovered, which were found in Cherokee County.

A Safe Company to Travel With.—It is said that the Cunard steamship company, which is now twenty-five years old, has never lost a life or letter during the many trips its steamers have made across the Atlantic.

THE KERN RIVER MINES.

What is generally known as the Kern River mines, embraces quite a large extent of country in Tulare county, to the southeast of the town of Visalia. It is divided into a number of districts, each of which, we believe, is alluded to separately in the letter of our correspondent which is given below. This region is beginning to attract a large amount of attention, and a strong current of emigration is now setting in that direction. It is estimated that there are not less than 1,000 miners now at work around the hills and hollows about the head of Clear Creek. There can scarcely be any doubt about the richness of these mines. They have been carefully and repeatedly examined by our best experts, who are unanimous in their opinion of their value. Quite a number of capitalists, who have long been engaged in quartz mining in other parts of this State and in Nevada, have recently invested in these mines, and are now engaged in putting up machinery. Several mills have already gone into operation with the most flattering results. The former prejudice against these mines is now fully broken down, and they are fast establishing a reputation which will soon place them among the most valuable of the gold mines of California. They yield by actual working from $30 to $50 and $75 per ton. The ledges are well developed and heavy, and the rock is very easily worked. We give below a very full and interesting letter descriptive of what is now going on in these mines. We hope to hear from our correspondent often :

THE WHITE RIVER DISTRICT

Is situated on White River, fifty-five miles from Visalia. The mines in this district have been worked successfully for several years; but new discoveries are constantly being made, among which we may mention the McCullough, on Keys Lode, and the Josephine Lode, belonging to C. F. Woods & Co., who have an 8-stamp mill. The rock from this claim pays from $45 to $75 per ton. The richest lode, perhaps, in this district, is the Sarah Campbell, owned by a Philadelphia company. This company have a patent crusher, and intend putting up a large mill. Their rock is said to pay $125 per ton. Many other parties are sinking upon lodes which they have discovered, most of which are very promising, so far as opened.

GREENHORN DISTRICT

Is situated on the summit of the mountain known by the same name. The altitude of this district is about 7,000 feet. It contains an abundance of timber, pine, oak, fir, and cedar, and plenty of water. The principal lodes that are being worked in this district, are the Sanders, owned by J. Lewis & Co., the rock from which is crushed in arastras, and pays about $60 on an average; another lode, the Rough and Ready, is worked by R. Hudnut, and pays from $35 to $70 per ton. It is worked by a water-mill, with five stamps, and subsequently run through arastras. Other lodes are being sunk upon with good prospects.

KEYSVILLE DISTRICT

Is situated on Kern River, east side of Greenhorn mountain, and is also a timbered country. The principal lodes in this district are the Old Mammoth lode, which has been worked for several years, paying an average of $36.50 per ton. It is worked by a water-mill, with eight stamps. The famous, though recently discovered Knickerbocker lode, owned by McCullough & Co., is also in this district; the owners are sinking down upon it, and it is proving remarkably rich. Next comes Balfish & Co., with mill and lodes. This company have sold their entire interest to Judge Walsh & Co., for a large amount of money, who intend putting up new machinery immediately. There are other lodes of very fine prospects in progress of development.

CAVE OR KERNVILLE DISTRICT,

Is also on Kern River, ten miles above Keysville, where the Big Blue and Summer lodes are situated. Most of the work going on in this district, is being done by A. Staples & Co. Mr. King, and the companies owning Bull Run, Summer and Frank lodes, are working seventy men and running three mills, with a capacity of twenty-two stamps, the average pay of rock being $38 per ton. Wheeler & Co. are also running arastras by water-power, on the Stone lode, which pays from $35 to $40 per ton. The village of Kernville is situated in this district, and contains two hotels and two stores, besides shops of different descriptions. Some fine gardens and farms are also to be found in this vicinity.

CLEAR CREEK MINES.

Havilla City is situated on Copperas Run, with plenty of timber and water. The town

consists of five hotels, eleven stores, six saloons and gambling houses, and four livery and sale stables. Stock-brokers, surveyors, lawyers, gamblers, dentists, prospectors, teamsters, French, Italians, and all kinds and characters of men, throng the streets from morning until night, and through the night until morning again, buying, selling, gambling and drinking—a perfect *fac simile* of Virginia City in 1861 and 1862. The mines now being worked are the Delphi, sixty-eight feet deep, eighteen inches wide, and pays $125 per ton. The Countess of Tyron has been sunk to the depth of forty feet, and pays $90 per ton. The owners of this mine, McRidney & Co., have a small mill of nine stamps (steam), with a capacity for sixteen more, which they intend putting in operation immediately. Marsh & Co., are running arastras on the following named lodes: Jupiter and Dundee, averaging $90 per ton; this company are putting up a mill of ten stamps; J. W. Freeman & Co., a custom steam mill, with four stamps, which is running finely; J. H. Thomas' mill, with four stamps, under the supervision of Mr. Stevens, is working well, and they are making the famous Rochford lode pay $100 per ton; the Uncle Abe, also, pays rich; McDonald & Co.'s mill, five stamps, is working well, and the lode, which is six feet in width, pays $80 per ton. The Treasure lode pays $160. This is the richest lode in the district yet discovered, it having paid as high as $336 per ton. This company have several other lodes that pay $25 to $60 per ton. The following lodes are being sunk upon, and rock is being taken out and waiting for mills to be completed to reduce it: Old Dominion, Sovereign, Stewart, and Exchequer, by A. Reed & Co. These lodes prove to be very rich, the proprietors having gone down to a depth of one hundred feet on some of them. Burditt & Co. are working the Antelope, Mountain, and Democrat, running tunnels and levels, and taking out good pay rock. Boyle & Calvin are sinking and taking out rock from the celebrated Bamboo lode, which is very rich. Miners are sinking and prospecting on a great number of lodes, some of which prospect well. There are recorded in this district nearly eight hundred lodes. The rock is generally very much decomposed, free from all metals except gold, and works very easy. The following companies are putting up mills: Banning & Co., capacity, twenty stamps; N. Stevens & Co., ten stamps; Burdett & Co., ten stamps; and Radcliffe & Co., with a patent crusher, supposed to be able to reduce fifteen tons per day; Marsh & Co. U. S. Marshal Rand, and Inspector Smith, have purchased large interests, and I am informed that they are going to put up heavy machinery. A French company have bought out Dr. Labarde & Co., and intend to put up a large mill; the purchase was made for the sum of $150,000. This district suffers a great deal from the want of mills. There is no question about the richness of the mines. The price of crushing is now $12 per ton. I will give more particulars in my next, when the mines are further developed.

LONG TOM DISTRICT,

Is situated near Posey Creek, Tulare county, seventy-five miles from Visalia. There is but one lode here now being worked—the Long Tom, belonging to Roberts & Co. They have a gang of hands sinking shafts, running levels, etc. This lode pays remarkably well, and is said to average $80 per ton. It is nearly four feet in width at the depth of sixty feet. There are other lodes in the neighborhood, but no other upon which work is now being done.

H. H.

PUBLIC DEBT OF THE UNITED STATES.—Secretary McCulloch has issued a statement of the public debt, as appears from the books, Treasurer's returns, and requisitions in the Department on the 31st of July, 1865. We recapitulate:

	Am't outstanding.	Interest.
Debt bearing interest in coin	$1,108,062,641 80	$61,521,837 50
Debt bearing interest in lawful money	1,289,156,515 05	74,740,630 78
Debt on which interest has ceased	1,527,120 00	
Debt bearing no interest,	357,900,963 92	
Totals	$2,757,253,275 86	$139,252,468 28

SOUTHERN PETROLEUM.—Three hundred gallons of crude oil have reached Los Angeles from the wells of the San Fernando District. It contains, by analysis, fifty-seven per cent. of illuminating, and thirty-three of lubricating property.

SOME of the river steamboats employed upon the Rhone are, according to a drawing exhibited in Paris, 250 feet long and 16 feet wide, the length being 15 2-3 times the width. The engines are 500 horse power.

THEY make big dividends in Taunton. The oil cloth company has declared an annual dividend of 50 per cent., with 50 per cent. surplus reserved; the American screw company has made monthly 10 per cent. dividends through out the year.

Delayed Letter from Summit City.*

EDITORS MINING AND SCIENTIFIC PRESS:—I arrived at this newly discovered El Dorado some two days since, and as I have not yet visited the mines here, I will speak more particularly of the place—its rapid growth and general appearance. Less than four weeks ago, two small shanties only were to be seen; now some 150 houses have been built, and every day new improvements are being made. The open lot of yesterday receives the skeleton of a one or two-story building, to be by to-morrow clothed and inhabited by its excited and wealthy (?) owner. Montgomery street only, during the wild-cat mania of '63, would be any parallel to the excitement witnessed here at this time. The day on which I arrived (Sunday), some 700 or 1,000 persons were witnessing the feats of a young disciple of Blondin, ascending a wire from the ground to the center of a large pine tree, while other portions of the city seemed not to be aware that a show was going on in town, so numerous are the scattered groups around.

This is the most beautifully romantic location for a town I have ever seen. Situated on the back-bone of the Sierra, at an altitude of over 8,000 feet above the level of the sea, and 2,000 feet higher than Virginia City, it may well claim its chosen name, "Summit City," Excelsior District. On the east side of the town is "Meadow Lake," one and a half miles long by some 600 yards wide, artificially formed by building an immense rock dam across the lower portion of the valley, some 600 feet long by 40 feet high. The dam was constructed by the well known Capt. Kidd, for mining purposes, and certainly seems to last much longer than his steamboats. The captain most assuredly deserves the gratitude of this virgin city for the beauty and benefit thus accidentally conferred upon her.

From the lake westward, the land rises gradually and crosses the summit by a natural, easy grade, for a distance of about one and a half miles, when you strike rocky mounds, hillocks, and ravines, over which the miners are scattered in every direction, prospecting for miles around. The town has already several hotels, among which I would mention the "Lake House," "Cosmopolitan," "Andrews' House," with innumerable restaurants, groceries, fruit stands, express offices, etc., etc., and indeed nearly everything you find in an old and well regulated city. The Israelites have also pitched their tents thickly around, and "*sheep clothing*" is abundant. It is astonishing, for the short space of time since the place was started, to witness the style of the hotels. I would particularly mention the "Lake House," at which I am stopping, kept by Mr. and Mrs. Lake, where you will find the table abundantly supplied with every substantial and luxury of the season, and the amiable madam, *in propria persona*, directing and catering for her numerous guests.

There are two principal roads leading hither, but the one mostly traveled at present is from Henness Pass, by which heavy wagons and loads weighing 6,000 pounds are brought in—distance about eight miles; the other, which leads from the Dutch Flat road, can only be passed by pack trains and pedestrians. The distance, as now traveled, is about ten miles. The Californians and Nevadans generally meet at the "Webber House," on the Henness Pass route, on their way hither, and mount stage, horse, or foot it—time, from two to four hours. The route, though tolerably rough, is yet very picturesque, with Truckee Lake to semi-circumvent, and the beautiful green meadows surrounding its borders to pass over, the trip is a very pleasant one. There is, I learn, a company organized under the superintendency of Capt. Hardy, of Virginia City, for the purpose of grading a toll road from the Webber House. The Dutch Flat route is also surveyed by another company and the work commenced. These roads are bound to be constructed at an early day, and they are certain to pay well. To-morrow I intend to visit the celebrated "Enterprise Ledge, located about six miles from here. I have seen enough, both in Virginia City and since I arrived here, to satisfy me of the almost fabulous richness of this lead; also, of Wisconsin, and many others, the ores of which I have seen, but will be better prepared to speak of them after a personal examination. L.

Summit City, August, 1865.

*The publication of this letter has been unavoidably delayed some three weeks.

THE word loyal is from the French *loi*, which signifies the *law*. Hence to be "loyal" is simply to abide by the law.

CHEMISTRY OF THE SUNBEAM.—The chemistry of the sunbeam; the dullest cannot fail to behold it every day, combining, transmitting and transforming, in its slightest processes, far beyond the skill and power of all human science combined. From the moment its laboratory opens through the gates of the dawn, until it closes with the last ray of twilight, all created things within its reach are quickened and modified by its touch. The insect and the bird, the grass-blade and the giant oak, man and beast, the air, the earth and the waters, all greet it as the subtlest and mightiest material agency of our planet.

So vast are its uplifting ministrations that the solid rocks and the very mountains are exalted in its presence. The eye of science has observed that under its vertical influence, in mid summer, the mass of granite on Bunker Hill is drawn upward beyond the power of all human appliance of mechanical force. And not only that granite column, but every expansive substance on the face of the earth, within the compass of the sunbeam, is uplifted.—Growth, form, color, fragrance; these are a part of its illimitable work throughout the domain of nature; aye, more, it seems almost as though universal life were its dependent. If it be shut out altogether, all life withers and dies; even its brief, unwonted absence droops the verdure of earth and the spirit of man.

Yet, mighty and all-prevading as it is, it can enter the pores of the finest steel, and nestle in the tiniest dew-drop. Flooding the earth with light, it stoops to nourish the smallest flower, and to gild even the mote that floats in its track. Busily working in every harvest field, it is still a seeming idler, playing hide-and-seek with shadow, and sporting on the wave, the woods and the mountains. Disdaining nothing, it glorifies all things. The lizard warms under it, even as the lark soars and sings. Prodigal of beneficence, its briefest shine is brighter than all earth's gold and gems. It is God's chemistry, developing the seeds and germs of a creation, which in its smallest part, equally with its greatest, attests the gracious omnipotence of its Creator.

EVEN THE HAIRS OF YOUR HEADS ARE NUMBERED.—To number the hairs of the head has been in all ages accounted as impossible a feat as to count the sands of the seashore. The astonishing labor has, however, been gone through by a German professor, who thus tabularxies the result of his examination of four heads of hair: Blonde (number of hairs), 140,400; brown, 109,440; black, 102 962; red, 88,740. The heads of hair were found to be nearly equal in weight, and the deficiency in the number of hairs in the black, brown and red colors was fully counterbalanced by a corresponding increase of bulk in the individual fibers. The average weight of a woman's head of hair is about fourteen ounces.

FIRES.—A correspondent who "keeps tally" of everything he reads gives the following aggregates of American casualties by fire and wreck from January 1st, 1843, to July 1st, 1865—22½ years:

Whole number of fires	5,615
Whole number of buildings consumed	291,210
Whole number of shipwrecks	1 821
Whole number of lives lost thereby	274 142
Cotton destroyed—pounds	1,579,672,000
Total losses by fire and wreck	$2,001,008,000

PETROLEUM.—The actual product of oil in Pennsylvania is set down at 3,500,000 barrels of crude oil for the year 1865, and worth, taking an average of prices, $24,000,000 at the mouth of the wells. The process of refining increases its value to over $60,000,000, or one-half as much as the wheat crop. The consumption of this newly-discovered illuminator and lubricator is increasing very rapidly, both at home and abroad. In 1862 Europe consumed 10,000,000 of gallons; in 1864 the importation had increased 300 per cent., 30,000,000 of gallons being consumed there; and in 1866 it is estimated that 90,000,000 gallons will be required. There is a brisk market for it the world over—Asia, Africa, South America, and the islands of the sea all calling for it. The best authorities on the subject consider eighteen months the natural life of an oil well. Some last longer than this, but the great majority give out before they are a year old. But experience shows that oil may be struck and good yields obtained in close proximity to exhausted wells. Some wells that refuse, under the most vigorous pumping, to yield a barrel more, are made productive by boring them deeper. The deepest wells in operation are but 500 to 600 feet. Scientific men contend that the greatest oil deposits underlie the earth's surface 1,000 to 1,200 feet. Considerable oil is produced in Canada and West Virginia, but the product is small compared with that of Pennsylvania.

WORKMEN are now engaged in removing the wood work, furniture, etc., from Ford's Theatre, preparatory to remodelling it as a fire-proof building for the reception of the archives of the late Rebel Government.

Grain Growing in California—Our Superior Crops Accounted For.

A writer in the *Cumberland Presbyter*, a valuable religious and family newspaper, published at Alamo, in this State, gives some reasons that have not been generally understood why the production of grain to the acre in California exceeds that of any other country. The writer thinks it is not owing to the superior fertility of the soil, so much as to the fact that in this State each head of grain contains more kernels than at the East. But is it not the superior strength and fertility of the soil that induces this better filling out of the meshes of the grain-head? Or is it the climate? The subject is worthy of fuller investigation, and we invite intelligent growers of the State to give us the result of their experiments and investigation. In the meantime, the subjoined communication will be read with interest:

One hundred bushels of wheat is sometimes obtained from an acre in California. I have heard of twenty acres the present season yielding 1,800 bushels, or 90 bushels to the acre. Sixty or seventy-five is not uncommon, and forty to sixty bushels are general when the soil and season are favorable to the production of grain. In most localities in the States, twenty bushels to the acre is a good crop. Twenty-five to thirty bushels is a fine crop, and forty to fifty bushels is a very extraordinary crop. The writer saw one piece of wheat in the States, and only two acres at that, which produced forty-two bushels and a half to the acre. This was the highest yield he ever saw. I know that occasionally there is a higher yield than even this, but I do not believe that there is a single county in any of the States which would yield more than twenty-five bushels as an average crop.

Those who have examined the subject closely believe that the soil is just as fertile there as in California. The superficial observer attributes these extraordinary yields to the wonderful fertility of the soil. I believe that the best soil in California is just as fertile as it is in the States and no more so; consequently we have to look to other causes for these very great yields.

The yield of straw here is no greater than in the States. But an examination of the heads will show that every mesh has in it from three to five kernels of wheat, and sometimes I have found as high as six in a single mesh. Also, every mesh on the head has wheat in it—the lowest and the very top one. Ordinarily, in the States, two or three of the lowest has no grain in it, and as many of the top ones; and generally those meshes which have wheat in them, have only two grains in them. I never saw a crop which had three grains to a mesh throughout the field. The number of meshes in the head there and here is about the same. But here all the meshes in the head have grain in them and so many more than there, and this constitutes the *great difference*.

From this it is evident that a head of wheat in California will have two to three times as many grains in it as in the States. Consequently, the produce of an acre or a field will be two to three times as much.

The important question arises, what causes this great difference? The climate chiefly.

WOOL PRODUCED AND MANUFACTURED IN CALIFORNIA.—The total wool production of California is 7,000,000 pounds per annum. The average price is about 19 cents—that of the South brings 16, of the northern counties 23. The best of our wool is manufactured at San Francisco, the rest exported. There are two woolen mills at San Francisco, consuming annually 2,400,000 pounds of raw wool, employing 450 laborers, $1,000,000 capital, and paying out $200,000 for wages. Their staple articles of manufacture are flannel, tweeds and blankets, for all of which, and much more, there is a very profitable home market. Considering that Calaveras, San Joaquin, Stanislaus, Merced, Fresno and Tuolumne counties produce annually nearly a million pounds of wool, and that the freight from this city to San Francisco would be saved thereby, why cannot we have a wool manufactory at Stockton? Experienced eastern operatives with whom we have conversed on the subject assure us that this city possesses many advantages over San Francisco as a place for this branch of manufactures.—*Stockton Independent.*

A. T. STEWART, of New York, is building a residence to cost at present estimates $1,200,000, though it is expected to run up to a higher figure. To secure a site for this structure, he is tearing down one of the finest palatial residences of Fifth Avenue.

SINCE the taking of Richmond, the capture of Lee's army, and the general collapse of the Rebellion, the mortality among the rebel prisoners in the North has very largely increased, owing to the disheartening influences which their hopeless defeat has engendered among them.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, September 23d, 1865.

There is no apparent dimiuutiou in the amount of capital offering for loan purposes, but the demand ou such securities as the bankers are willing to accept, is rather lighter than usual. Business requirements are moderate, and good mercantile paper is readily taken at 1¼ ₱ cent. ₱ mouth, with occasional negotiations at 1 ₱ cent. The fluctuating character of many of the stock collaterals offered, induces more discrimination on the part of lenders, but outside loans are made at 1½@2 ₱ ccnt. ₱ month.

The receipts of Treasure from domestic sources, since Saturday last, amounted to $1,100,000, making an aggregate of $3,250,000 thus far during the current month. At this season of the year, the receipts from the interior invariably show a falling off, as compared with other periods.

The bullion market was left quite bare at the close of last week, and sales of gold bars were freely made at 860@865. During the past few days they have been taken to account by bankers at about 840, and are in some demand at that figure. Silver bars are also a shade better, and may be quoted at ½ ₱ cent. premium for average lots.

Legal Tender Notes are more active, and small sales have been made at 72¼@74c, closing at 74½ bid, 74 asked. A light requirement prevails at the present moment, but a better demand is anticipated soon for excise, and other purposes. Our latest telegraphic advices from the East quote gold at 143¾.

The general market for most stocks has been without especial animation this week, the excitement being mainly confined to the shares of one company, in which very large transactions took place at variable rates. The magnitude of these operations has elicited considerable discussion in stock circles, but the real character of the movement, and the causes which led to the decline are, we think, now more clearly understood. City stocks are, with scarce an exception, all strongly held at the recent advance.

Pacific Insurance was sold at $185, and is now held at $190. The affairs of this company are in a very promising condition, and their surplus assets, including the rise in the value of securities deposited in Nevada and Oregon, are said to exceed 65 ₱ cent. of the par value of the stock. Union Insurance is in favor at $65 ₱ share bid, for $40 paid. Fireman's Fund is inquired for at $120 ₱ share. The third installment of 50 ₱ cent. on new issue of this stock, will be due on Monday next. California Steam Navigation is offered at 785; San Francisco Gas at $100, and State Telegraph at $30.

Alpha fell from $2,275 to $2,100, and is now well maintained at about $2,100. The third week's crushing of the company's new mill realized some $22,000, from about 350 tons of ore, making in all thus far $58,500, from 1,100 tons of ore.

Yellow Jacket has been dealt in to the extent of 136 feet, advancing from $1,360, seller 30, to $1,430, then selling at $1,415, and closing at $1,390. During week ending 11th inst., 1,269 tons of second class ore were extracted from the mine, and 1,048 tons were reduced, yielding $37,195.06, or an average of $35.46 per ton. Telegraphic advices state, that the east drift from the old shaft in the lower level, has penetrated a body of good ore.

Gould & Curry receded from $1,300 to $1,200, and is now offered at $1,240. We learn of nothing new in this mine. There is no material change in the affairs of the company, and a dividend for the current month is somewhat problematical.

Savage declined from $1,270 to $1,205; rose to $1,230, and sold yesterday at $1,225 per foot. The product of this claim will, it is thought, average about 125 tons of ore per day for September—say 3,250 tons, yielding about $40 per ton for the entire month.

Crown Point has been in better favor, steadily rising from $1,100 to $1,170, then selling at $1,180, and closing at $1,160 bid. In all some 40 feet changed hands. In the lower level drift, some favorable indications have been met with, and the pay strata is supposed to be in close proximity. Belcher rose from $915 to $930; fell to $880, seller 30, and closed at $890 bid.

Ophir advanced from $415 to $455, receded to $415, then sold at $430, seller 10, and closed at $450@440. In drifting from the fourth station, near the border of the old "eave of 1863," a small body of ore has been found. Both mills are now at work, reducing some 30 tons of ore and tailings per day. The tailings bought of the Gould & Curry Co. are producing a net yield to the Ophir of $11 per ton. Receipts thus far the current month, amount to $27,000. On Thursday last, the water in the Mexican shaft was 150 feet in depth. No settlement has been made public with the Burning Moscow Company, so far as we are informed.

Hale & Norcross rose from $505 to $550, fell to $520, and closed yesterday at $520 bid. Chollar fell from $450 to $400, rallied to $422½, receded to $405, seller 30, and closed at $410 bid. Potosi has been dealt in within a range of $405@$410, closing at $405 bid. There is no material change in these two mines. Empire Mill and Mining Co. fell from $357 to $325, rallied to $335, and sold yesterday at $335. There is no change to report in the condition of this mine.

Imperial has absorbed a large share of the attention of the Board, and 2,500 shares were sold, receding from $255 to $230, rallying to $240, declining to $215, advancing to $238, dropping to $231, rising to $246, and selling yesterday at $240@$237½. The receipts of the company since the 10th inst. amounted to $33,000, and are lighter than usual, owing to the poverty of the ores reduced. The 2,000 tons of high grade ores on hand have been held in reserve, and the ores worked thus far the current month were, it is said, expected to show a poor result. The crushings for the balance of the month are likely to be more favorable, and will probably realize not less than $50,000, which, added to the actual surplus remaining on hand, after discounting all unpaid bills, will make an aggregate of $100,000, less, say $40,000, for the ordinary expenses of the mine. In other words, there will be at least $60,000 in the treasury of the company for the next dividend on the 10th of October. We have good authority for this statement.

The lower level drift has developed a body of fine ore, 50 feet in width, and a deposit of poor ore, mixed with porphyry, some 10 feet wide, with about 20 feet yet to run before reaching the east wall of the ledge.

Overman declined from $180 to $169, and sold yesterday at $162 bid. Confidence has been dull and inactive at $125@$124, closing at $125, asked. Bullion steadily receded from $135 to $122½, and sold yesterday at $22½. Daney is also in less favor, declining from $47½ to $33, and closing at about $35.

Burning Moscow declined from $20 to $5, rallied to $6, and closes at $4. Sierra Nevada has been dealt in within a range of $22½@$20, seller 30. North American was sold at $22@$25; Caledonia Tunnel at $8@$7; Wide West at $8@$6½; Baltimore American at $15, and Nevada (J. G.) at $21@$20.

The total recorded sales of stocks at the Board since Saturday last inclusive, amounted to $1,170,234.

MINING AND SCIENTIFIC PRESS PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely conclude his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $15 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fee for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we a cause through investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specification alled in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The plan adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or polished; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be collected. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Economy In Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

Mechanical.

THE IRON AND FOUNDRY INTERESTS OF SAN FRANCISCO.

NUMBER SEVEN—LOCOMOTIVE BUILDING.

It is a noticeable peculiarity of our California artizans and mechanics, that they appear to leave behind them, when they come to this country, the local peculiarities and notions which are always found to attach to the mechanics of the Eastern States, and indeed to those of almost every part of the world outside of California. One of the greatest drawbacks of our Eastern shops, is the disinclination of any one of them to adopt any manifest improvement introduced hy another. Rather than do so, they will set their wits to work to devise some other way to arrive at the same end r ached by another, and oftentimes adopt a complex and quite inferior plan for the simple one first suggested. This disposition grows out of an undue spirit of rivalry between different shops abroad, which is not found existing here. The mechanics of California are cosmopolitan, in fact as well as in feeling; hence their freedom from local jealousies and notions, and the easy adaptability of their genius to the particular and peculiar necessities which are met with on this coast. Hence also the facility with which almost the entire machinery connected with the great industry of mining has been so completely revolutionized in California. So it is with almost every other class of m chinery which has been called largely into use on this coast. This peculiarity is most strongly developed in the

HISTORY OF LOCOMOTIVE BUILDING IN CALIFORNIA.

A branch of business which promises to soon occupy a very important position among the leading mechanical interests of the State. It may be interesting at this time, and in view of its future growth, to give, in this connection, a minute history of the business up to the present time.

As soon as it became apparent that San Francisco was destined to become a great city, attention began to be directed to the enlargement and improvement of the area for its future growth, and it at once became apparent that the sand-hills which formed such a forbidding aspect on its southern and western borders, should be smoothed away, and their debris employed for filling up the low lands and tide-water flats. No sooner did the necessity appear, than the genius of our mechanics was set to work to devise some substitute for the high price of labor which then ruled. A "Steam Paddy" was consequently improvised, and a "pony engine" constructed to wait upon it. That pony engine, which is still doing good service in the sand hills, was the first locomotive constructed on the Pacific coast. The Market Street Railroad was the next necessity which presented itself in this connection; and an engine suitable for such a road was forthwith constructed. Since that time our mechanics have gone on, fitting the locomotives to the particular work required of them, until, a few weeks since, the Union Foundry turned out a heavy, first-class locomotive, which was appropriately christened "California," and which so surprised our people by its superior finish and performance on the San Jose Railroad a few days since.

But to go back and take up the history of locomotive building in detail, we find that the first locomotive built on this coast, was completed in November, 1859. The boiler was made at P. Donahue's shop (now the Union Iron Works), on First street. The machine work was done by Stoddard & Young; the engine was set up in a building in the rear of Hobb's & Gillmore's planing mill, on Market street. It was designed and put together by C. W. Stevens, for Brooks, Stewart & McCoy, and employed, as already stated, to haul sand cars from the steam Paddy, and is still in use for the same purpose. It has four 30-inch driving wheels connected, and two 6x12-inch cylinders, is geared two to one, and weighs about eight tons.

The second, or No. 2, was a "locomotive car," built for the San Francisco Market Street Railroad Company. It was commenced on the 18th day of May, 1860, and so far completed as to make several trips over the road to the Mission and back on the 4th of July following. It was built in the shop of John Spratt, on Pine street, where the Academy of Music now stands, under the superintendence and after the plans made by C. W. Stevens, then master mechanic of the Market Street Railroad. This engine had one pair of drivers thirty inches in diameter, with cylinders 6x14 inches. The third and fourth in order were also locomotive cars, built and designed by the same parties as No. 2, for the Market Street Railroad Company. These locomotives are all still running on that road; they had each one pair of drivers three feet in diameter, with cylinders 9x14 inches.

The fifth was built for the Market Street Railroad Company, in 1861; part of the machinery was fitted up by Devoe & Densmore, corner of Fremont and Market streets. It was put together at the Railroad Company's shop at the Mission, by its designer, C. W. Stevens. This locomotive has one pair of drivers three feet diameter, with cylinders 9x14 inches—built in 1861.

The sixth is a geared locomotive, built for Col. J. S. Ruckel, of Oregon; weight eight tons, and was built at the Vulcan Iron Works, after plans made by C. W. Stevens, in the winter of 1861–2. It ran on a road which was built around the Cascade Falls, on the Oregon side of the Columbia River, and was the first locomotive ever used in Oregon.

The seventh was a regular detached locomotive, weighing about twelve tons, with two pairs of 3-feet driving wheels connected, with cylinders 9x18 inches. It was built for the Oregon Steam Navigation Co., and is still running on their road around the Cascade Falls, on the Washington Territory side of the Columbia River, and was the first locomotive used in Washington Territory. This was also built by the Vulcan Iron Works Co., designed by C. W. Stevens, and completed and shipped from the shop in May, 1862.

The eighth is exactly like the seventh, built and designed by the same parties, and shipped from the shop in May, 1862, and for the same company. It is running on the Dalles Railroad in Oregon. The first time steam was got up, it went up a grade of 376 feet to the mile. This feat was accomplished on a temporary railway, constructed to land it from the vessel, on the elevated bank of the river.

The ninth was built for the San Francisco and Alameda Railroad Company. The boiler and castings were made at the Vulcan Iron Works; the fitting up and putting together was done at the railroad company's shop in Oakland. It has one pair of driving wheels four feet six inches diameter, with 9x18-inch cylinders, and is now running on the Oakland road. It was designed and put together by C. W. Stevens, and was completed September 10th, 1862.

The tenth and eleventh were built by the Vulcan Iron Works Company, for the Alameda Railroad, after designs and plans of the same parties, but was put together under the superintendence of A. L. Stevens, master mechanic of the Alameda Railroad, where both engines are now running.

The twelfth and thirteenth in regular order, but the first of the new or heavy class, were built by Booth & Co., of the Union Iron Works, where two more of the same class are now nearly completed. These engines have already been described in our columns.

J. G. BENNETT, of the N. Y. *Herald*, has purchased the ground on which stood Barnum's great museum. He has 12 years time to pay $450,000; and pays Barnum $200,000 for a lease of the ground which has 12 years yet to run. The lot is 65 by 100 feet. Bennett purposes putting up a building to cost $300,000.

A FINE piece of carpeting, measuring 14 feet by 20, the first of the kind manufactured in Austria, has just been placed in the Museum at Vienna. It presents a map of the railways of Central Europe, and was produced at Prague.

The British Parliamentary Elections.

Full returns of the British Parliamentary elections have been received. They show a decided victory in favor of the Liberals. The House of Commons is composed of 658 members. The Liberals have returned 367, the Conservatives or Tories, 290, one district is contested. This gives a Liberal majority of 77. But this majority is not compact; "for," says the New York *Tribune* "the position of many of the members is difficult to define." Among the Liberals, as among the Union men of the United States, are radicals, moderates, and conservatives; and so among the Tories are similar subdivision and classifications. In the last Parliament 30 Liberals voted against a bill extending the franchise to tenants paying £20 house rent in towns. Of those who so voted, several have been defeated at the late election, which is something of a guarantee that the Parliament elect will grant an extension of the franchise. Among the distinguished Liberals elected are John Bright, Milner Gibson, John Stuart Mill, E. Baines, and Lord Cavendish, all of them early and able friends of the United States during our late civil war. Among the distinguished Tories and enemies of this country, returned, are Roebuck, Gregory, and the pirate ship builder Laird, who sent out the Alabama. Several other notable Tories and enemies of the United States holding seats in the last Parliament have been knocked out of the ring and succeeded by Liberals and friends of this country. Ramsden, who was rebuked by Lord John Russell for declaring from his seat his joy that "the bubble republic had burst," is succeeded by Lord Frederick Cavendish, "the only English nobleman who publicly spoke in favor of the North in its days of struggle and doubt." On the British election contest as related to the American question, the *Tribune* remarks: "Although the American question entered directly into very few of the contested elections, there is no doubt whatever that the result of our war had a great influence upon the general course of the peaceful contest which has just closed in Great Britain. The demonstration here given that popular government has not failed, and the general satisfaction that is felt in England over the non-intervention policy of the Palmerston Government, have strengthened the hands of the advanced Liberals immensely. Our example has shown that popular sovereignty is far removed from anarchy; and the Tories are deprived of their most cogent argument against trusting the mass of the people with power."

SUBSIDENCE OF THE EARTH'S CRUST.—The commune of Buonanotte in France, is hourly threatened with utter destruction. Five manufactories have already been overthrown, and sixty-four more are threatened with imminent ruin. The inhabitants have fled in the greatest terror to the neighboring villages. The cause of the disaster is a sudden and violent depression of the soil, which is at the present time accounted for by one or two reasons—either the fall of an immense mass of earth in the west of the district, or the yielding of the roof of an extensive subterranean cavern. But in reality nothing certain is yet known as to the cause of this most deplorable event. A number of civil engineers have hastened to the spot, and prompt measures are in course of adoption to prevent still greater disaster.

AMBERGRIS.—The schooner S. E. Lewis, recently arrived at Boston from a whaling voyage in the Atlantic, brought home forty pounds of ambergris, a very scarce and valuable article, the market price of which is about seven to eight dollars per ounce. It was taken from the intestines of a whale. Ambergris is a substance highly valued in the manufacture of perfumery, and its commercial value varies accordingly to the amount held in the markets of the world. Before the establishment of the whale fishery, many years ago, it was sometimes found floating on the surface of the ocean, generally on the coast of Africa, and sought a market through the eastern world. This substance is the result of some peculiar disease in the intestines of the whale, very much as the pearl results from a disease of the shell-fish in which it is secreted.

COPPER AND GOLD IN PRINTING PAPER.—It has been chemically ascertained that the paper of books printed in the sixteenth century contains particles of copper, and even gold. This may be explained by the fact that the stuffs employed in those days for the manufacture of paper often contained metallic threads, as it was the fashion then to wear a good deal of brocade.

AMERICANS IN EUROPE.—It is estimated that there are about one hundred thousand Americans in Europe at this time. Probably there will have been altogether not less than two hundred thousand there in the course of this Summer. Paris is, of course, their chief place of resort, but they penetrate into every country of Europe.

GOLD MINES ON THE ISTHMUS OF PANAMA. Senor Antonio Tijera, a gentleman from the interior of the State, and well known among the merchants of this city, says the Panama *Star and Herald*, has just brought several boxes of specimens from the gold mines which he possesses in a district adjoining that of Santiago de Veraguas. A competent assayer, who has had much practice in South America, declares that the specimens are of the best kind, and that one which we had in our hands, would yield at least ten per cent. of pure gold. The same gentleman is so satisfied with the general character of the specimens as indicating rich deposits, that he has determined to join Senor Tijera in the enterprise; and through his enthusiasm on the subject several other practical and experienced Americans and Englishmen, among whom are machinists and engineers, are now forming a company to assist in the working of the mines. Senor Tijera tells us, and his statement is confirmed by a letter from an American at Santiago, that the mills are all erected and that all the appliances are at hand to proceed in the elaboration of the auriferous deposits. There appears to be no doubt, from what we have seen and heard, that with a little financial assistance, at once, the enterprise is sure to succeed, and that a fair chance is now offered for the investment of money in a safe and profitable undertaking.

THE American Antiquarian Society of Worcester Mass., was founded in 1812 by Isaiah Thomas, a well known antiquarian author, printer and bookseller. The library contains about 40,000 bound volumes, besides pamphlets, antiquities, relics, works of art, etc. It is understood to have a fund of $43,000, the income of which is devoted toward the necessary expenses of the institution. It contains original pictures of the Mathers—Samuel Cotton, Increase, and others. A prominent feature is the entire library of Cotton Mather, rich in Puritanic divinity and the decayed leather which antiquarians love. A gigantic statue of a horned Moses (the horns exhibiting the play of the light upon his head "like unto horns," according to the early Bible.) sits in the vestibule, and there is in the library a figure of our Saviour with the cross of like size. These statues, copies of Michael Angelo, were presented by Salisbury, the president. Antiquarian Hall is an ample brick building, and its construction is an honor to the State and country.

PATRIOTISM UNDER A QUILT.—Six young Nantucket ladies made a quilt for the soldiers in January, 1863, upon which they inscribed their names. It was feared that the quilt had been captured by the rebels, but the other day the ladies received a letter from our gallant Capt. Argan, of Rhode Island Fifth, who secured it among his outfit upon escaping from his eleven months' rebel imprisonment. The Captain expresses his regard for the six names which have become so familiar to him, and hopes they may long continue although he wouldn't object to either of the Misses changing her name should a deserving opportunity occur.

A NEW MINING REGION.—James M. Day writes to Gov. Blasdel, from Salt Lake City, a letter descriptive of a new mining region, which he supposes to be in the southeastern corner of Nevada. The letter is published in the Carson *Appeal*, which paper supposes the new mines to be in Utah and not in Nevada. The mines are in what is called Parranagat Lake District, and about one hundred and twenty miles from Call's Steamboat Landing, on the Colorado river. Day speaks of the mines as being rich in silver, and asks for information from the Governor in regard to the proper steps to be taken for the organization of a county.

INCONVENIENT POPULARITY.—A Pennsylvania paper makes the queer announcement that the people of Lancaster have elected Ex-President Buchanan to the high and responsible office of Constable for three years successively. Three times he has been compelled to go before the proper authority, and swear that he was elected without his consent and that he didn't want the office.

THE famous rose-tree planted a thousand years ago by the Emperor Louis le Debonnaire, in the eastern choir of the cathedral at Hildersheim, has been in particularly fine bloom this season, and looks fresher and greener than ever. Two shoots, which sprang up from the knotty millenial roots of the tree in 1863, have attained already the height of the roof.

IT is said that during the last ten years the trade of England has nearly doubled, and wealth has been accumulated at a marvelous rate.

THE LARGEST CANAL in the world is one in China, which passes over two thousand miles and forty-one cities. It was commenced in the tenth century.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good Journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Sept. 23, 1865.

SODIUM AMALGAM.

We have declined to give place in our columns to any of the various paragraphs, which have of late been going the rounds of the press of this State in reference to the newly discovered use of *sodium amalgam*, as an aid to the working of auriferous and argentiferous sulphurets, and to the amalgamation of the free precious metals, for the reason that nearly all which has yet appeared on the subject is quite crude and unintelligible, and much of which is manifestly in direct conflict with well known chemical science. An elaborate series of experiments is now in progress in this city, under the direction of competent persons, with the view of ascertaining, by practical operations, the actual effect which is produced by the use of this amalgam in the working of the various ores, and its chemical affinities in relation to their principal constituents. So soon as these experiments are completed, the result will be made known through the columns of the Mining and Scientific Press. In the mean time proper furnaces are being constructed for the manufacture of the metal, at the laboratory of Dr. Lanszweert, on Silver street, in this city; for enough is already known to give it a value in this market, and to insure its introduction on a scale of greater or less magnitude into amalgamtion for both gold and silver. The proprietors of this paper will be prepared in a few days to furnish the fullest information obtainable as to its use, price, etc. We are also prepared to receive (if sent free of transportation) small samples of ore—from one to twenty-five pounds—as a fair average, and give the same a thorough working test, and therefrom furnish, at a mere nominal cost, the necessary information to enable parties interested, to work their ores successfully on a large scale, by the use of this newly applied agent. We have undertaken this work with special reference to the furtherance of the mining interest generally, by the intelligent introduction of this new and important agent into the amalgamating room.

Improved Saw Mill.—The San Francisco Foundry are now building one of J. Hendy's improved double circular saw mills, including a gang of circulars, for Trinidad, Humboldt county, California. The lumber to be sawed by this mill is intended for the San Francisco market.

The New Match Factory recently established at Marysville, by Messrs. Smiley & Simmons, is now ready to supply orders promptly from all parts of Northern California. The proprietors have had much experience in their business.

MINING ACCIDENTS.

There is probably no business followed upon land liable to such a great sacrifice of human life by accidents, as that of mining. This is true even when every precaution is taken which human foresight can employ. Hence the importance that nothing, within the convenient reach of mining superintendents should be neglected to secure to the miner immunity from danger. One of the most common class of accidents of which we hear, are those attending the work about shafts, and the passage of the workmen up and down these thoroughfares to and from their daily labor. At the same time, by the exercise of a little care and precaution, there is no class of accidents which are so completely under the control of the superintendent. The safety-cage and the safety-hook, are within the reach of all; and we have never heard of a bucket disengaged from the rope where a safety-hook was employed, or any serious accident happening in a shaft which was fitted with an improved safety-cage; yet scarcely a week passes without the loss of one or more lives, somewhere among our mines on this coast, where these precautions are not employed. So important is the employment of these safeguards considered in England, that their use, under certain circumstances, has been made a matter of legislative requirement. It would be well for our own law-givers to consider the propriety of some similar enactment for California and Oregon. Employers have no right to trifle with, or needlessly endanger, the lives and limbs of their employees. We have been led to these remarks from reading the following notice, where six lives were almost miraculously saved the past week, at Virginia City. We copy from the *Enterprise*:

Last evening about six o'clock, at the change of "shifts" at the Imperial mine, Gold Hill, six men came up the main shaft on the cage, and on arriving at the surface stepped off, when almost instantly the cable parted and the cage was precipitated several hundred feet to the bottom of the shaft and smashed to pieces. How the cable came to last till the cage with its living freight reached the surface, and then broke just as it was relieved of its load, is one of those wonderful occurrences for which there is no accounting. Had the cable parted a moment sooner, the chances are that every man upon the cage would have been killed.

We are also reminded of an occurrence which took place in the same neighborhood, a short time since, in the Sierra Nevada mine, if we are not mistaken. A safety-cage is employed there, and on the occasion alluded to it had been loaded very heavily with ore, and just as it reached the top of their deep shaft the rope parted. The load was so very heavy, that the descent of the cage could not be completely checked, even by the approved means employed, and it went to the bottom; but at such a slow rate that everything was landed safe and sound; not a bolt was started or a timber broken. It is easy to imagine the crash and destruction which would have followed if the safety-clutch had not been attached to the cage. We again repeat, that no shaft of any considerable depth, should be without this safeguard to life and limb; and no shaft of any depth, not even a hand-windlass, should be employed without a safety-hook. There is a pecuniary economy in their employment, even if no higher consideration is taken into account.

Eighty Miles of "Feet."—Mr. Morgan, Recorder of Excelsior, has been figuring. He says that since June, 1863, when the first locations were made, there have been made eighty miles of locations on leads within the district, embracing over 416,700 feet of ground. Excelsior is a good country for "feet."

Invention.—Thomas R. Land of Graes Valley has invented an improvement on the hook used in holding cars, tubs or cages in their descent into shafts, which the *National* pronounces a good thing.

The degree of Master of Arts has been voted to Senator Stewart, of Nevada, by Yale College.

Patent Telegraph Reel.—We would call especial attention to an advertisement in another column under the head of "Patent Paper Reel for Telegraph Register." This advertisement has been called out by an editorial notice which appeared in the Mining and Scientific Press some three weeks since, of an invention by Mr. L. W. Worth, of Sonoma, of an apparatus for the more convenient adjustment of the ribbon of paper employed in telegraph offices, on which the messages are recorded by the instrument, and by which the ribbon may be readily passed and repassed through the instrument. Mr. McGann, of this city, claims to have already obtained a patent for the same invention, for which Mr. Worth has applied for a patent. Without expressing any opinion as to the conflicting claim set up, we have no hesitation in saying that the improvement is a very important one, and one which must undoubtedly find its way into telegraph offices generally.

Iron Smelting in Colorado.—According to the Denver *News*, the business of iron smelting may now be said to be fairly inaugurated in Colorado. It appears that the Belmont furnace is in operation near Denver, and is turning out two tons of pig iron per day. The ores used are pronounced by competent judges to be the best in the world, and are excelled in richness only by the Pilot Knob and Lake Superior ores; but possess an advantage over these in the fact that they can be easier and more economically worked. The supply of ore is deemed inexhaustible and is easily obtained, one man being able to mine three tons of it in a day.

A New Vegetable.—The Esmeralda *Union* has been furnished with some specimens of "tapoos," which, it says, is the name given by the Indians of Owens River Valley to a rich grass root which grows abundantly in that section, and which they gather to subsist upon in winter as they gather pine nuts for the same purpose. The root or bulb, when divested of the chaff surrounding it, is about the size of a large pea, is of a dark brown color, and has a rich, pleasant taste, similar to that of a hazelnut though much sweeter. In its present wild state it is far superior to many of our favorite garden vegetables of the pea and bean kind.

Asphaltum Discovery in Virginia.—A large deposit of what is probably asphaltum, has been discovered in West Virginia, about ten miles from Cairo, and thirty-one east of Parkersburg, Va. According to the account before us, it "lays in a stratified form, and the vein is from 55 inches deep, to 250 feet thick. So far as traced, the lode is about a mile in length"—a very lucid description truly. Chemical analysis shows it to be "solidified petroleum, chrystalized upon the outside of the vein, and granulated inside." It has been found "possible to distil from the substance a pure oil, at the rate of 160 to 170 gallons to the ton."

Land Titles in the Pennsylvania Oil Regions.—It appears that our Pennsylvania brethren are beginning to be troubled with vexatious lawsuits. In consequence of the loose manner in which business was transacted pertaining to the transfer of real estate in Venanga County, Pa., when the lands were of little value, there has, now that the oil region has become so valuable, arisen great embarrassments to the validity of titles. Real estate litigation is rapidly increasing, and millions of property are in dispute.

Rich Mine.—We understand that one of the leading quartz mines in Grass Valley, has divided within a small fraction of one million of dollars, within the past three years. This is pretty good for a company in which there are only four stockholders.

The New York police picked up over ten thousand lost children last year. All but two hundred and eleven were reclaimed, and these were turned over to the Commissioners of Charities and Corrections.

Cachoiong.—This mineral, according to the Stockton *Independent*, has been found by C. D. Gibbes, in his "opal mine," which he is now working in the coast range of mountains. According to the report before us, we should judge that it was found unusually massive, as it is described as occurring in veins [masses?] three or four feet wide. The editor of the *Independent* has seen a beautiful specimen of this rock, highly polished, and speaks of it as occurring sufficiently massive for table-tops, etc. Cachoiong is a variety of the opal, and, like that mineral, is of volcanic origin, resulting chiefly from molten silex. It is nearly opaque, of a porcelain or bluish white color. It has heretofore been chiefly found on the river Cach, in Bucharia. It consists of from 95@96 per cent. of silex, with 3.47 of water of chrystalization. It usually contains from 0.2@0.7 per cent. each of sodium, potassium, carbon, manganese, and alumina. It is to these minerals that it owes its color.

A Great Natural Curiosity.

The Jacksonville, Oregon, *Sentinel* describes a remarkable natural curiosity, known as the Great Sunken Lake, and situated in the Cascade mountains, about seventy-five miles northeast from Jacksonville. This lake rivals the famous valley of Sinbad the Sailor. It is thought to average 2,000 feet down to the water all round. The walls are almost perpendicular, running down into the water and leaving no beach. The depth of the water is unknown, and its surface is smooth and unruffled, as it lies so far below the surface of the mountain that the currents of air do not affect it. Its length is estimated at twelve miles, and its width at ten. There is an island in its centre, having trees upon it. No living man has ever been able, nor probably ever will be, to reach the water's edge. It lies silent, still and mysterious in the bosom of the "everlasting hills," like a huge well scooped out by the hands of the giant genii of the mountains, in the unknown ages gone by, and around it the primeval forests watch and ward are keeping.

The visiting party fired a rifle several times into the water, at an angle of forty-five degrees, and were able to note several seconds of time from the report of the gun until the ball struck the water. Such seems incredible but is vouched for by some of our most reliable citizens. The lake is certainly a most remarkable curiosity.

The breaking out of the cholera, which is now raging in Egypt, is owing to the pernicious vapors from Mount Araphat since the fetes of the Courban Bairam. Thousands of sheep are sacrificed during the celebration of these ceremonies. The sultan Abdul-Medjid had founded an endowment of 40,000 piastres, to be spent annually for the interment of the remains and offal of the sacrificed beasts, which created so fearful an amount of malaria. On this last occasion it appears that the 40,000 piastres have been duly paid to the contractor for this business, who has quietly pocketed the money and left the putrid mass of flesh to engender disease and destruction over the world.

A Conglomerate Snake.—The latest snake story is told, in good faith, by the Springfield (Mass) *Republican*, of a reptile recently found at Lee. It was nearly four feet in length, about the size of a man's finger, and shaped like a whip-lash; and on a close examination the whole body was found to be composed of small worms about half an inch in length, with large black head and semi-transparent body. On separating them into fragments they would immediately reform into the snake shape and crawl slowly off. One or two other similar snakes have recently been seen in that vicinity. It is to be hoped that they will remain there.

Horses Feeding one Another.—M. de Bousanelle, captain of cavalry, in the regiment of Beauvillers, relates in his Military Observations, "That an old horse of his company, that was very fine and full of mettle, had his teeth all of a sudden so worn that he could not chew his hay and corn; and that he was fed for two months, and would have been so, had he been kept, by two horses on each side of him, that eat in the same manger; that these two horses drew hay from the same rack, which they chewed and afterwards threw before him; they did the same with the oats, which they ground very small, and also put before him. This," added he, "was observed and witnessed by a whole company of cavalry officers and men."

Not a single West Pointer has yet been pardoned by the President. Many of them are begging the boon of mercy, but their misdeeds are remembered against them and they are denied pardon.

MECHANICS' INSTITUTE FAIR.

Award of Premiums.

The Committees on award of premiums to exhibitors at the late Fair of the Mechanics' Institute, have completed their labors, and we give below the list of awards as revised and furnished us by the officers of the Institute:

THE INSTITUTE MEDAL.

This medal, the first of the kind ever awarded by the Mechanics' Institute, was designed for that invention, manufacture, or industrial product, which should be decided to hold out promise of the greatest practical benefit to the people of California. In accordance with the decision of a Committee, of which the Governor of the State was Chairman, the medal was awarded to the Pioneer Woolen Mills of San Francisco.

THE FIVE GOLD MEDALS.

These medals were prepared by the Institute as awards to "articles of new invention of great practical utility to the community, or to manufactures of especial value to the State." Upon the recommendation of Committees appointed for the purpose, the awards are as follows:

To L. Prevost, of San Jose, for the culture of silk-worms—one medal.

To Mathew Keller, of Los Angeles, for the culture of cotton—one medal.

To H. J. Booth, of San Francisco, for a steam engine—one medal.

To Jacob Zech, of San Francisco, for the manufacture of pianos—one medal.

To P. Mezzara, of San Francisco, for the statue of Lincoln—one medal.

DIPLOMAS, CERTIFICATES OF MERIT, AND SILVER MEDALS.

The other awards made by the Institute consist of diplomas, certificates of merit, and silver medals. The first premium is a diploma, and the second premium a certificate of merit. Both diplomas and certificates of merit are, however, frequently awarded where there is no competition, and in such cases the award is given as a "diploma" or "certificate of merit" instead of first or second premium.

The silver medals, of which fifty were provided, are awarded by the Executive Committee of the Institute, as special premiums for domestic inventions and manufactures of superior merit, and in cases where there was competition.

First Department.

C. H. Harrison, city, eccentric steam wrecking pump—silver medal.

A. Hunter, city, grain separator—silver medal.

W. W. Hunscom, quartz crusher—silver medal.

W. R. Frink, city, improved soda machine—diploma.

Pacific Straw Works, for manufacture of bonnets—silver medal.

The Hansbrow Pump Company, of Sacramento, for force pump—silver medal.

Adolphe Hecker, city, finishing lathe—diploma.

V. Cushing & Co., city, excelsior pumps—silver medal.

Thomas Varney, city, amalgamator—silver medal.

J. M. Beath, city, quartz grinder—diploma.

Bargion & Johnson, city, model rock crusher—certificate of merit.

E. T. Steen, city, steam engine.

W. R. Eckart, city, cut-off valve indicator—silver medal.

Vulcan Iron Works, city, double-piston steam engine—silver medal.

Rufus Howland, city, one tree-nail machine—diploma.

Wm. Bruckner, city, rotating roasting furnace—silver medal.

C. Roberts & Co., city, mining car—diploma.

Wheeler & Randall, city, amalgamator—silver medal.

J. B. Baux, city, Baux & Guiod's separator and amalgamator—silver medal.

Israel W. Knox, city, amalgamator and separator—silver medal.

P. Hinckle, city, grinder and amalgamator—certificate of merit.

H. Pierce, city, quartz crusher—certificate of merit.

J. Heudy, city, ore concentrator—certificate of merit.

Rix, Logan & Co., city, Hammer Battery—silver medal.

John Dougherty, city, soap-stone machine—certificate of merit.

Second Department.

Dr. Calvert, city, dental goods—silver medal.

Knowles & Clark, city, artificial teeth on gold—diploma.

E. Belle, city, painless tooth extractor—diploma.

B. L. Solomon & Son, city, decorative upholstery—diploma.

Meyer & Jonasson, city, ladies' cloaks—second premium

A. Muller, sable cape—first premium.

I. C. Meyer & Son, ermine cape—first premium.

W. F. Burke, city, ladies' gaiters—silver medal.

Miss L. C. Baldwin, Marysville, hair work—certificate of merit.

G. B. Hitchcock & Co., city account hooks—silver medal.

R. F. Rocchiccioli, city, electrotyping—silver medal.

Rubber Clothing Company, city, for rubber clothing—certificate of merit.

John Martell, city, silver plated goods—first premium.

Daniel Winter, city, glass signs—first premium.

I. Joseph & Co., city, boy's clothing—first premium.

P. Kelley, city, men's calf boots—silver medal.

Goodwin & Co., city, for unique furniture upholstery (easy chair)—silver medal.

J. L. Ney, city, mantilla work—certificate of merit.

C. A. Fletcher, city, boys' clothing—second premium.

Theodore Van Tassel, city, silk hats—first premium.

J. H. Hammond, city, suit of army clothing—silver medal.

Jules Rolland, city, extension lounge—certificate of merit.

Kerby, Byrne & Co., city, velvet circular—first premium.

J. & C. Schreiber, city, patent spring mattress—certificate of merit.

Third Department.

B. F. Barker, city, patent door spring—diploma.

John Denn, Sacramento, improved cider press—first premium.

E. W. Walton, Drytown, wine and cider press—second premium.

D. & H. A. Winter, city, seed sower and cultivator—first premium.

John M. Horner, city, washing machine—first premium.

Sheffield & Patterson, city, manufacture of saws—first premium.

J. A. Dibblee, Santa Clara, large milk cans—first premium.

F. Nernich, city, cooperage—diploma.

J. L. Chase, city, wasbing machine—certificate of merit.

A. E. White, city, boot-blacking machine—certificate of merit.

Johnson & Reay, city, patent ventilator—silver medal.

H. M. Bernard, Sacramento City, track sulky—second premium.

Kirby & Co., Santa Cruz, sole leather—silver medal.

San Francisco Glass Works, manufactured glass—silver medal.

A. S. Hallidie, city, wire rope—silver medal.

L. Hallaway, Alameda, gang plow—silver medal.

John Mallon & Co., city, ground and cut glass—silver medal.

V. S. W. Parkhurst, city, combination locks—certificate of merit.

M. M. Cook & Son, city, California Manufactured Hose—silver medal.

Will & Finck, city, cutlery—first premium.

Macdonald & Bros., city, sawed cedar lumber—silver medal.

Joshua Hendy, city, blow-pipes—certificate of merit.

James Longshore, city, trunks and valises—diploma.

William Turnbull, city, horse collars—certificate of merit.

C. M. Sickler, city, milk cans and tinware—second premium.

W. T. Garratt, city, brass finishing—silver medal.

Taylor & Iredale, city, California manufactured stove—silver medal.

Easton Bros., city, office secretaries—first premium.

D. Conrad, city, office secretaries—second premium.

Gallagher, Weed & White, city, brass castings—diploma.

J Strahle, city, billiard cushions—first premium.

P. Leisenfield, city, billiard tables—first premium.

A. Folsom, city, light sulky—first premium.

R. Liddle & Co., rifle and shot guns—first premium.

Mullear & Bender, city, improved bench planes—diploma.

M. Price, city, California manufactured cutlery—second premium.

Wilson & Evans, city, sporting implements—certificate of merit.

Charles Slotterbuch, city, telescopic rifle—silver medal.

Brown & Butters, Oakland, shoemakers' lasts—certificate of merit.

Cameron, Whittier & Co., city, silvering glass for mirrors—silver medal.

Fr. H. Rosenbaum & Co., city, mirrors—certificate of merit.

Union Carriage Factory, city, milk wagon—diploma.

J. E. Jorgenson, city, chimney-top—first premium.

Fourth Department.

Rose Lash, city, crotchet bed spread—first premium.

Loomis & Smith, city, lithographs—first premium.

Mrs. E. Piper, formerly Mrs. Morris, city, gents' furnishing goods—first premium.

G. H. Baker, city, lithographic engraving—second premium,

C. W. Boynton, city, mechanical drawing—first premium.

F. S. Butler, city, caligraphy—silver medal.

E. P. Heald, city, penmanship—first premium.

Isabella Howard, city, abdominal supporters—first premium.

Samuel C. Higgins, city, mechanical drawing of locomotive—certificate of merit.

George Pfaff, city, California manufactured flutes—diploma.

Samuel Kellett, city, plaster ornaments and stucco work—silver medal.

Miss E. V. Green, city, wax flowers—first premium.

Daniel Norcross, city, military goods—diploma.

Dr. H. H. Thrall, city, artificial teeth, on vulcanized rubber—first premium.

Mrs. R. C. Alden, city, scarfs—first premium.

Mrs. S. Von Room, city, crochet tidy—first premium.

Bennett & Butler, city, improved dental chair—silver medal.

Mrs. N. G. Kittle, city, worked chemise and pillow-slips—first premium.

Mrs. R. Velasco, city, three embroidered handkerchiefs—certificate of merit.

Mrs. M. Curtis, city, mathematical models for cutting garments—diploma.

Mrs. M. D. Willis, city, fancy quilt—first premium.

England & Turnbull, city, architectural drawings—first premium.

Mrs. C. Cook, city, ornamental hair-work—first premium.

John Roach, city, transit instrument—silver medal.

Miss M. Tolle, city, silk-embroidered bed-quilt—diploma.

F. Arriola, city, portrait painting—silver medal.

Mrs. J. B. Harmstead, city, wax fruit and shells—first premium.

F. A. Butman, city, landscape painting—silver medal.

Nahl Bros. & Dickman, city, oil painting of horse and rider—silver medal.

Miss Mattie Love, city, wax flowers—second premium.

Lawrence & Houseworth, city, stereoscopic views of California scenery—diploma.

A. Kohler, city, Bradbury's pianos—first premium.

Badger & Lindenherger, city, Chickering's grand piano—diploma.

C. C. Keene, city, California manufactured accordeons—first premium.

PHOTOGRAPHS.

The following exhibitors of photographs decided to place their pictures in competition—viz: Bradley & Rulofson, Addis & Koch, Jacob Shew, Nahl Bros. & Dickman, R. Winter, C. E. Watkins, M. Klein. The awards made pursuant to the majority report of the committee appointed for the purpose, are as follows:

Bradley & Rulofson—First premium for life and cabinet size photographs retouched, and for card pictures standing and sitting. Special premium for superior plain photographs.

Addis & Koch—First premium for ivorytypes and vignettes. Special premium for superior plain photographs.

Jacob Shew—Second premium for large photographs retouched, and for general collection of card pictures. Special premium for card pictures. Certificate of merit for plain photographs.

Nahl Bros. & Dickman—First premium for water-colored photographs and for porcelain pictures. Certificate of merit for plain photographs.

Robert Winter—Second premium for water-colored photographs.

C. E. Watkins—Special premium for photographs of California scenery.

M. Klein—Special premium for city views.

Fifth Department.

I. D. Thompson, city, whisky—first premium.

John Sweet, city, Tokay wine—first premium.

Jas. McCaffrus, Santa Barbara, port wine—first premium.

S. Brannan, city, pure juice of the grape—first premium.

Isaac Bromham, San Jose, red wine—first premium,

D. E. Hough, Oakland, best display of fruit—diploma.

M. Keller, city, wine bitters—first premium.

B. D. Wilson & Son, city, California brandy—first premium.

United Anaheim Association, city, white wine—first premium.

J. Sajous, city, "Half and Half"—first premium.

D. L. Perkins, city, California seeds—silver medal.

Mr. Despuis, San Jose, best grapes—first premium.

B. N. Bugbee, box raisins—diploma.

Simon Statas, best specimen of hops—certificate of merit.

Z. Sikes, roller grain mill—second premium.

M. Doane, hay press—second premium.

E. F. Moek, Petaluma, rotary folding hay press—diploma.

T. Maher, Watsonville, convertible gang plow—diploma.

Mrs. Richards, Mission, flowers—certificate of merit.

John Ross, flowers—certificate of merit.

Collie & Stewart, budding plants—certificate of merit.

James Lick, flowers and fruit—diploma.

Mr. Nolan, plants—certificate of merit.

Sixth Department.

S. P. Taylor, Tayloraville, wrapping paper—silver medal.

E. Benoist, city, distilling oils—diploma.

Koenig Brothers, city, riding boots—first premium.

Standard Soap Company, city, soap and washing powders—first premium.

A. B. Winegar, city, crushed salt—second premium.

B. H. Ramsdell, city, specimen of coal—diploma.

California Borax Company, city, borax—silver medal.

C. A. Plummer & Co., fine salt—first premium.

Miss Maggie Coughlin, city, soft soap—certificate of merit.

Brignardello, Machievello & Co., macaroni and vermicelli paste—silver medal.

J. A. Bauer, city, preparation of gold, silver and copper—diploma.

G. W. Gibb & Co., city, case of colors—diploma.

Dewey & Co., city, bound newspapers—MINING AND SCIENTIFIC PRESS—diploma.

A. Grimm, city, hair rejuvenator—diploma.

W. G. Jones, city, California resin—diploma.

Dellwig & Brothers, city, confectionery—first premium.

Joshua Hendy, city, gang circular sawn lumber—silver medal.

W. P. Harrison, agent for San Lorenzo Paper Mills, newspaper—first premium.

San Francisco and Pacific Sugar Refinery, refined sugars—silver medal.

Charles Bernard, city, coffee and spices—first premium.

W. H. Scoville & Co., city, California manufactured candles—silver medal.

William H. Martin, city, Benicia cement—diploma.

Tripp & Robinson, city, fire-works—certificate of merit.

Macpherson & Wetherbee, redwood lumber, diploma.

W. H. Jessup, Eureka Match Factory, California matches—first premium.

J. Pierce & Co., parlor furniture—first premium

Capt. J. M. Aiken, cabinet of minerals—silver medal.

F. E. Mills, album stereoscope—silver medal.

Mrs. John Harding, for skillful embroidering—silver medal.

J. Wiechart, iron safe—diploma.

J. A. W. Lundborg, city, spring flower dentrifice—silver medal.

J. F. Fugazzi, city, case of perfumery—silver medal.

Swain & Brown, city, fancy cakes—first premium.

A. Besson, city, concentrated milk—silver medal.

A. F. Mitchell, city, California made watch, complete—silver medal.

V. Squarza, city, "essential oil extractor" and compounds—diploma.

Attwood & Bordwell, city, windwill—diploma.

Graves & Smith, city, coppersmith work—diploma.

J. L. Moulthrop, city, covering for hydraulic hose—certificate of merit.

T. H. Selby & Co., city, California made lead pipe—silver medal.

Church & Clark, city, fire works—diploma.

Tubbs & Co., city, cordage—silver medal.

Miss Mary Gray, city, chenille work—first premium.

Mrs E. M. Cottrell, city, worsted work (carpet)—diploma.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

THE STATE FAIR.

The races at the Fair grounds appear to be the most attractive feature of the season. The opening race between "Norfolk" and "Lodi," on Monday, seemed to be the principal theme of conversation among fast stock fanciers. A majority opinion seems to prevail that the winner, "Norfolk," is capable of making better time and beating anything yet on record. Time on Monday, two miles, 3:37 2-5—3:38½. Both dogs run again on Saturday for the Society's purse of $1,000.

The display of horses this year is very fine. Their parade around the course forms an interesting and pleasing feature. The show of sheep is creditable as to number and quality. The grand parade of stock on Tuesday embraced seventy-four horses; two jacks of extravagant dimensions and exquisite proportions; from one to two dozen short horned cattle, including two large durham bulls, one weighing upwards of 2,300 lbs., the other in the neighborhood of 2,800. The first mentioned bouncing bully hails from England and as a compliment to his high blooded ancestry, is placarded with his pedigree to ggggggd. The few cows entered are fine looking. Only a few fat porkers are exhibited.

We were most interested at the grounds in viewing the two beautiful cashmere goats, owned by Mr. Landrum, of Stockton. Their fleeces, white as snow, soft and glossy as silk really glisten in splendor to the eye. This stock was first sent from Turkey as a reciprocating compliment to our Government for favors shown in the introduction of cotton within the realms of the Sultan. The fleece of these goats reach as high as seven pounds, worth not less than $2 per pound. Length of staple about ten inches.

At the Pavilion on Tuesday evening, Dr. Morse, of San Francisco, delivered a pleasing and entertaining address. The attendance was large; heat excessive. The Fair is said to be less attractive than in former years, yet the hall is tolerably well filled and presents many interesting features, and must be looked upon with considerable credit by those not too familiar with the articles introduced from the Mechanics' Fair. Some fancy work presented by the ladies shows uncommon nicety of finish and taste. This department is well sustained, and we are not sure but close scrutiny with good judgment would render the show of this class of industry here a premium over that exhibited at San Francisco. Mrs. Gov. Low has two superbly worked Afghans which are a real credit in taste, skill, and mechanical industry. In fact, much of the worsted work, hair work, wax work, shell work, etc., will bear the most strict examination with uniform credit.

The sewing machine fraternity are represented by the Grover & Baker, Florence, and Howe. Among other familiar articles from the San Francisco Exhibition we would mention those of W. R. Frink's, soda fountain; Squarza, Will & Finck. J. & C. Schrieber, Koenig Bros., G. R. Porter, M. Keller, Goodwin & Co., Mrs. M. S. Reed, B. D. Wilson, S. P. Taylor, Mrs. C. M. Chapman, Dewey & Co., L. Prevost, M. K. Landenslager, Mrs. C. Cook, John Swett, A. Dreyfoos, N. E. White, P. Mezzara, Wheeler & Randall, Leonard Low, Hansbrow Pump Co., Leffel & Myers, D. Winter, A. N. Rood & Co., S. Brannan, J. C. Mayer & Sons, Bullard & Battles, A. Badlam, W. B. Lake, T. B. Lamb, etc. Col Warren, of the *California Farmer*, has a fine show of curiosities and vegetable antiquities, with some new and rare samples from the vegetable kingdom of the Sandwich Islands. The display of minerals is limited to some dozen samples, mostly by Mr. Layne, of the Layne G. & S. M. Co., near Folsom. He has a particularly fine sample of ore from the Layne lode showing native silver.

Hon. A. A. Sargent speaks at the Pavilion to-night and will have a crowded house. Our time being limited we must defer any further remarks about the Fair. The city just now appears brisk. Liquor shops and saloons of varied entertainments are wonderfully prevalent. The operations of the Central Pacific Railroad seems to give encouragement and confidence for the future of the city. Work on the State Capitol is brisk. The weather cool and fine. A boat race is expected on on the river soon. We examined one of the competing skiffs at the Union Iron Works yesterday. It is about twenty-two feet in length, straight, frail, and light, looking as an arrow. Total weight is about forty pounds with draft of two and a half inches with a person of 150 pounds. Hastily D.

Sacramento, Thursday, Sept., 21st, 1865.

THE HUMBOLDT OIL REGIONS.

The controversy which has long been going on as to the existence of petroleum in paying quantities on this coast, seems to be fast approaching an affirmative conclusion; for we are now receiving small shipments of crude oil by nearly every arrival from Humboldt county, the locality where the first developments were made, and where the work of boring has been most perseveringly persisted in.

The most important surface indications in this county, are found along the banks of the Mattole creek, and here the first wells were sunk, and the first oil struck in depth. By a careful examination of the country, however, those versed in the search after oil, have of late preferred to go north of the Mattole creek in the prosecution of their explorations. They have been led to this from the peculiar change in the oil strata, which is observable to the northward, especially along the sea coast, near and at the mouth of Eel river. The strata there is found to be nearly horizontal, or with but a slight dip to the north, which inclination rapidly increases as the traveler passes south, until it attains a uniform inclination of nearly, or quite, 45°. The argument to be deduced from these facts is, that the greater disturbance south, opens a vent for the escape of the oil at the surface, and renders the surface indications much more noticeable than, where, by a lack of this disturbance, the oil must be kept more closely confined in its subterranean receptacles, until the augur of the prospector reaches its pent-up confines, and gives it an artificial vent for the benefit of the human race, for whose use it was originally designed. A careful examination of the country, from the Mattole creek all the way even to the extreme northern limits of the county, gives the most assuring indications of the existence of oil. The oil produced in the Eel river valley, and to the northward of that point, can be taken to market at a small expense for transportation. With this view of the case, operators are now taking active steps for the development of the oil interest all along the Eel river valley, and in the vicinity of Eureka. Several wells are now in progress; and the probabilities are, that the resources of Humboldt county, in this particular, will soon be largely increased. Nothing but a lack of facilities for transportation prevents, even now, a large supply of the crude oil coming to this market, from the Mattole, instead of the driblets of the few barrels at a time, which we are now receiving.

THE LATE STRIKE IN THE CALEDONIAN TUNNEL.—The Caledonian Tunnel Company of Virginia City have been incessantly at work upon their big tunnel, for five years past, until they have penetrated 2,000 feet into the mountain, cutting three several ledges. They claim title to ten—their ground being bounded on the north by the Overman. The Virginia *Union* of the 15th, says the north drift, which has recently disclosed a seam in the distance of fifty-five feet, has widened to a mass of pay ore, constantly increasing in size and quality, which it is thought will now pay $50 to the ton. The Company think they have the Comstock ledge, or if not, at least something quite as good. The Gold Hill *News*, in speaking of the same strike, says:

This ledge was cut some two years since, but was very narrow at that point in the tunnel. A drift was run south some five hundred feet, and although a large body of quartz was found, it was mostly barren. About six weeks since, another drift was run to the north on the seam, which, at a distance of fifty-five feet, has widened to a fine mass of pay ore, at least nine feet in width, and increasing in good general appearance as the drift is driven on the ledge. About fifty tons of ore have now been carthed, and will doubtless work at least $50 per ton by mill process, as the assayed value is much higher. In a short time this ore will be crushed,, and the Caledonia will realize its first bar of bullion. The character of the ore from the first ledge is evidently very similar to all the ore from the Comstock lode, and we saw a large amount that showed silver sulphurets in a crystallized formation. The foreman, Mr. R. Kavanagh, furnished us with all necessary information, and we could hardly avoid partaking of his exhilaration at viewing the really fine ledge, that will doubtless prove very valuable to the lucky stockholders.

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,

No. 548 Clay street, near Montgomery, San Francisco

THE remarkable statement is made that, out of the last one hundred persons who have committed murder in New York city, not five have been hanged.

AN eminent coroner in London recently declared that there were 12,000 mothers in the metropolis who murdered their children.

Metallurgy.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

CHURCH AND STEAMBOAT BELLS, OF ALL SIZES, made to order. Engineers' Gongs made and hung in the best manner. Bank, Vault, Store and Prison Locks; also Brass Padlocks and Shop Locks of various patterns, on hand and made to order.

☞ Particular attention given to casting Rudder Braces and Ship Work in general.

☞ All Jobs promptly attended to. Prices moderate.☜ No. 125 First street, opposite Minna, next door to Pacific Foundry. 22tf

[Removed from Oregon street, between Front and Davis.]

INEXPLOSIVE GUNPOWDER.—A London letter of recent date says: "Beside the method rendering gunpowder inexplosive, invented by Mr. Gale, and which the government seems disposed to purchase, we have two new explosives. One is a very strong gunpowder, which is made up of two portions like a seidlitz powder, each inexplosive by itself, to be mixed together before loading the rifle. It has been tried at our nearest shooting-grounds, it is said with good success. The other is a mixture for blasting, a liquid composed of one part of glycerine and three parts of nitric acid. This is poured into a very small hole in a rock, and some water—the only tamping required—is poured on top. A fuse, passing through the water, explodes the mixture with a force so much greater than gunpowder as to very much reduce the cost of such operations."

A FRENCH statistician has discovered the important fact that fewer women than men are struck by lightning. Out of 800 sufferers from lightning in France in ten years only 243 were women, and in England the proportion was still smaller. In many cases, the lightning falling in the midst of groups of persons of both sexes, struck men, in preference to women, whom it spared more or less. What can be the cause of this remarkable difference on the part of the electric fluid?

THE European physicians have experimented until at last they are able to cure the Russian Plague. Out of 364 patients recently admitted in one hospital, only 97 died.

STONES were first used for bullets; iron ones are first mentioned in 1540. Leaden bullets were made before the close of the sixteenth century. Stone cannon balls are still used in the East.

IT is computed that there are 800 acres in cotton in this State, this year. It appears to thrive best in Tulare and Los Angeles counties

SAN JOSE INSTITUTE
—AND—
COMMERCIAL COLLEGE,
LOCATED AT SAN JOSE, CAL.
MALE AND FEMALE.

The next session of this Institution will commence on
Monday, July 31, 1865.

An experienced and competent BOARD OF INSTRUCTION is engaged, and every facility will be afforded for a thorough course of study, both in the Academic and Commercial Departments.
Catalogues, containing full particulars, furnished upon application to

MITCHELL'S
COMBINED
FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.
The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.
The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.
Residence, 320 Taylor street, near O'Farrell street.
D. C. MITCHELL, Prop'r.
San Francisco, Aug. 22d, 1865. 10v11-3m

THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Eyerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

QUARTZ OPERATOR'S
HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.
BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs. W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Bolshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postag paid, $1.25. Address "Wheeler & Randall, at the Min'n and Scientific Press Office, San Francisco." 2v11

James Morgan	143	50	25 00

And in accordance with law, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, California, on the thirtieth day of September, 1865, at the hour of twelve o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

C. H. BURTON, Secretary.

Office, Room 4, N.W. corner Clay and Front street, San Francisco, Cal. se16-3w

Wallpi Gold and Silver Mining Company, Moss Lode, San Francisco Mining District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 12th day of September, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable on the 16th day of September, 1865, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. CONCDON, Secretary.

Office, 620 Washington street (Room 5). se16

Wide West Gold and Silver Mining Company, Silver Mountain District, Alpine County, California. Assessment No. 4.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of September, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to F. L. JACKSON, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 410 Montgomery street, San Francisco.

NOTICE.—At the above meeting Assessment No. 2 of 50 cents per share, levied August 22d, 1864, and assessment No. 3, levied March 18th, 1865, also for 50 cents per share, were rescinded, and stockholders having paid the same, or any portion thereof, will be credited on above Assessment No. 4 accordingly.

se16 W. D. ROOT, Secretary.

Yankee Blade Tunnel Company, Reese River District, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 4th day of September, 1865, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable on the 6th day of September, 1865, in United States gold and silver coin, to the Secretary, at his office, 305 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 7th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 27th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.

Office, 305 Montgomery street, San Francisco. se9

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

THE Kennebec *Journal* says that a few years since, the wife of the then American Minister to England, received from a friend in New England a box of autumnal leaves, selected for their beauty and their variety of tints. The lady wore them as ornaments, and they attracted much attention, and were greatly admired by the English people. Since then these leaves have been in demand there, and every autumn packages of them are sent over in the steamer, and flash their beauty in the high circles of London.

THE taxes on manufacturers of Philadelphia for a single year, amount to nearly seven millions of dollars.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Par Value.....$50 00

W. F. BRANDRETH.....President

J. M. BUFFINGTON.....Secretary and Treasuror

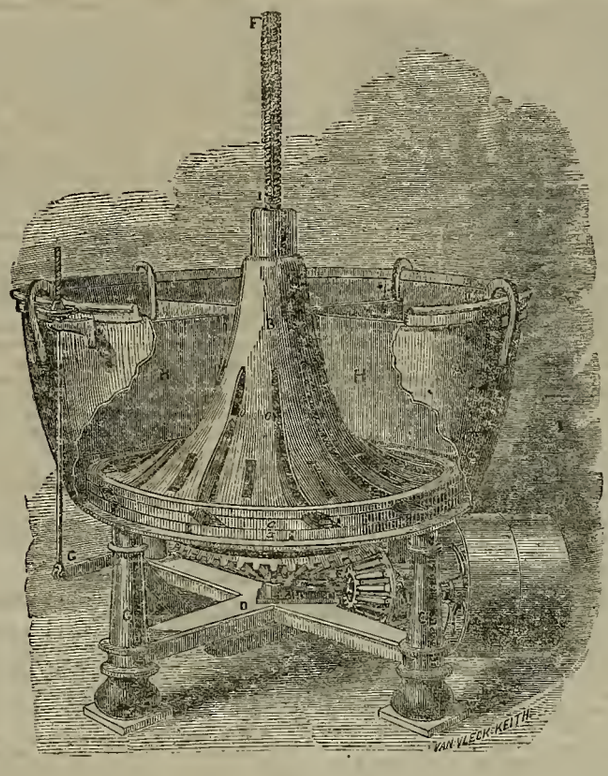
OFFICE—Room No. 10 Government House, corner of Sansome and Washington Sts., San Francisco.

The claims of this Company consists of SIX HUNDRED AND FORTY (640) ACRES, situated on Kellog Creek, in the Marsh Creek Mining District, Contra Costa county, Cal.

One thousand (1,000) shares of the contingent fund is offered at the low price of ONE ($1.00) DOLLAR per share, full paid, all the stock being unassessable. All who wish to purchase, or make any enquiry concerning the Company, will please call on the Secretary,

J. M. BUFFINGTON,

2v11 Corner of Sansome and Washington streets.



THE EXCELSIOR

GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

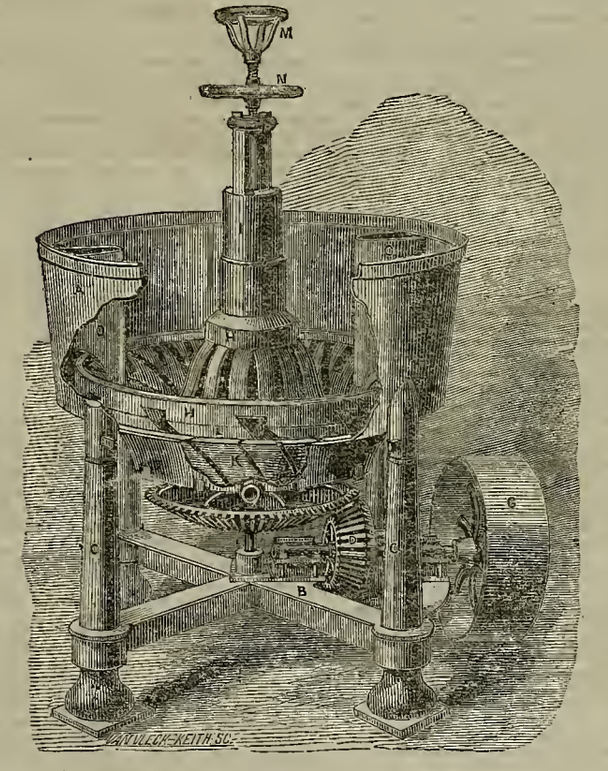
Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.



THE

WHEELER & RANDALL

Grinder and Amalgamator

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

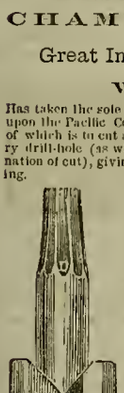
Machinery.

ATTENTION, MINERS!
LINSCOTT'S PATENT
CHAMBER DRILL.
Great Improving in Blasting.
W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.



D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ⅛ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

M. DISNEY'S
Endless Chain Water Wheel

Gives the greatest power from the same amount of water of any wheel in use. Every pound of water used gives one pound power. It is cheap and easily constructed, and can be built anywhere, and may be so constructed as to give any amount of power according to the amount of water and the fall. It is now on exhibition at

521 Market street, in this City.

All are invited to call and see for themselves. We are ready to put in Wheels either on sluggish streams or under head. RIGHTS FOR SALE.

☞ This Wheel is peculiarly adapted to running streams, where parties cannot build dams so as to make use of the fall.

M. DISNEY, Inventor.
San Francisco, Sept. 6th, 1865. 11v10-4w

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for pronducing simi ar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 861.] HEPBURN & PETERSON,
. nov8 3m*

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1861; his Comanche Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, concentrate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,
24v9

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
— AND —
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,
Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apertire and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

NOTICE.

The undersigned having purchased the EXCLUSIVE RIGHT in and for the State of California, for the

Manufacture and Sale of
WINHAM'S
PATENT HOSE COUPLING,

Hereby caution all parties against the manufacture or purchase of the above Hose Couplings, except through us, as any infringement will be prosecuted to the full extent the law.

SALMON'S
PROPELLOR AMALGAMATOR
— AND —
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address
9v11 J. & W. C. SALMON.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to
JOHN MAILER,
Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco.

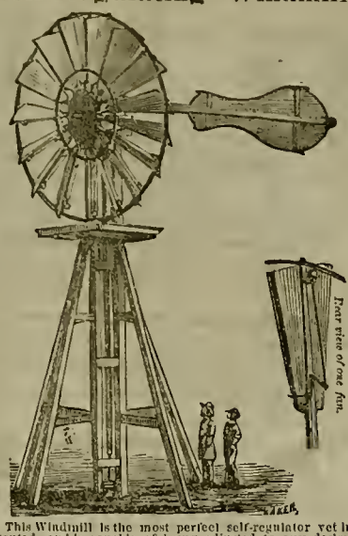
ATWOOD'S
Self-Regulating Windmill.



This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

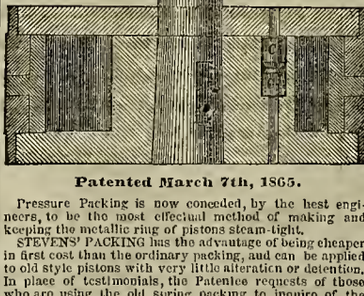
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE,

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 20 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,
At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11-tf

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
16-1m

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Washoe Amalgamation Works, Nevada, Cal.; Cold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Hengh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water or Steam Power. For further information address W. W. HANSCOM.
Golden State Iron Works, San Francisco.

RUM AND SUGAR IN THE LUMP.—A new process of boiling the juice of the sugar-cane has recently been introduced in the island of Antigua, West Indies, which does not convert the juice into separate articles, distinct in nature, such as sugar, molasses and rum, but into a solid compound containing all these articles in a single mass, from which, afterwards, the refiner extracts the various articles of commerce which it contains. The new process was discovered by an English chemist, and it is thought that it will work quite a revolution in sugar making everywhere.

Away with Spectacles.

Old Eyes made new, without SPECTACLES, DOCTOR, or MEDICINE. Pamphlet mailed free on receipt of ten cents. Address E. B. FOOTE, M.D., No. 1130 Broadway, New York.

"Patent Paper Reel for Telegraph Register."

SAN FRANCISCO, Sept. 18, 1865.

ENG. MINING AND SCIENTIFIC PRESS—*Sirs:*—Having noticed the above heading in your valuable paper of the 9th inst., I beg leave to inform you that the invention is not Mr. L. W. Worth's, but one already patented by me, while a resident of Cleveland, Ohio. His form of reel is one that I first got up in 1863, and filed a caveat for, and afterwards improved by putting some gearing, or clock machinery, so as not to use so much cord. The length of cord that I use now to run all day, would not run his reel one hour. After making my improvement, I applied for a patent, which was granted to me on the 19th of January, 1864. That patent covers all of his, so-called, improvement, as will be seen by my patent (No. 41,312) which claim reads as follows:

"What I claim for my improvement, is the arrangement of the mutually exchangeable reels D and F, in combination with the gears, cord, pulleys, and weight, the several parts being constructed, arranged, and operating as and for the purpose herein set forth."

This patent was obtained for me by Messrs. Brainard & Burridge, of Cleveland, Ohio, Patent Solicitors. And I further state, that all persons wishing to use said Paper Reels, will please to come and make arrangements with me for their use. As for any advantage he has over other reels, it can only be that he has a greater length of cord to to wind up. Those that I built, of his style, before I had mine patented and after I filed a caveat, had all to be exchanged for my new Reel. In putting mine up it takes only six screws to do the whole business, and takes up so little room that it is quite a convenient and useful instrument.

Address, HENRY McGANN,
12v11 At the Union Works, First st., San Francisco.

OIL WELL BORERS.

A CONTRACT WILL BE LET TO A RESPONSIBLE party to sink an Oil Well, as deep as may be required, on land belonging to the "Eel River Oil Company," situated in Humboldt county, Cal. For particulars, inquire at the office of the Company, No. 436 Jackson st., up stairs.
12v11-1m E. H. WILSON, Secretary.

THE STYLE

—FOR—

Fall and Winter, 1865,

Will be introduced Aug. 26, at

MEUSSDORFFER'S

HAT MANUFACTORIES,

Nos. 635 & 637 Commercial st., San Francisco,

No. 125 J st., bet. Fourth & Fifth, Sacramento.

Corner D and Second Streets, Marysville.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing those diseases.

E

USE HELMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from exeess and imprudenee in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—*in Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

MACHINE SHOP.—Among the smaller machine shops in this city, none are, perhaps, more worthy of notice than that of Mr. George T. Pracy, 109 and 110 Fremont street. This establishment is devoted almost entirely to light wrought iron work, in which department it certainly excels. Mr. P. attends to his work in person, and everything he undertakes will have all the advantages that can be given by his own practiced eye and skillful hand. He takes especial pride in the neatness and perfection of his machinery, of which he has an abundance for his work. Two large and small lathes, and a beautiful planing machine, which Mr. P. calls the best in the city, are driven by a small vertical steam engine, of five inches in diameter and twelve-inch stroke, the whole being finished and cared for in the best manner. Repairing is made a special branch of his business, and in this particular he cannot be easily excelled. Give him a call. Mr. Pracy is particularly conversant with all descriptions of printing machinery, and does the principal part of the repairs upon printing presses called for in this city. He is well known to the fraternity.

THE OVERLAND MAIL is now very regular in its arrivals and beats the steamers badly. The route is said to be in fine running order, and the coaches are making trips with unusual despatch and regularity carrying letters through in 22 days. On Tuesday evening last, fifteen bags, containing 22,000 letters, were received at the San Francisco Post Office, by this route.

OIL FROM BITUMINOUS SHALE.—A Sydney company, in New South Wales, have begun largely the distillation of bituminous shale, discovered in inexhaustible quantities in two different places. The Australian market has been an immense one for kerosene, but they claim now to have coal measures of their own which will meet the full demand.

THE VIRGINIA ENTERPRISE.—D. E. McCarthy has parted with his interest in this journal to J. T. Goodman, who is now the sole proprietor.

A MINERS' CONVENTION.

A project has been started for holding a Pacific Convention of miners. Much good would doubtless result from such an assemblage, especially if it could be made general in its representation, a proper concert of action obtained, and an intelligent interchange of opinion and experience secured from those present. The *Territorial Enterprise* is decidedly in favor of the project, of which it speaks as follows:

There is no branch of industry in the United States suffering more from the want of intelligent and economical management than gold and silver mining. This, we presume, will not be denied. Agriculturalists of every State have their fairs and conventions, where the results of their labors are made known, and every valuable information relating to the pursuit imparted; the wool and wine growers have their associations for the interchange of opinion and the advancement of the interests they represent; merchants combine for mutual protection, and their chambers of commerce legislate for the government of trade; publishers and printers, carpenters and blacksmiths, shoemakers and masons, tailors and barbers, all have their associations: yet the gold and silver miners of the Pacific States and Territories continue to labor without concert, to toil without reward, to invest their money without return. They embark in the business without any practical knowledge of it, and, blind to the lessons of experience, are continually adding to the list of mining bankrupts and shaking confidence in a pursuit which if intelligently followed, would be no more precarious than that of commerce. How may this evil be corrected. May a remedy not be found in the inauguration of some system by which the results of experiments and the suggestions of science may be generally disseminated?—by which the miners of the Pacific States and Territories may be enabled to interchange views, and unite in recommending such measures as may be deemed best calculated to advance the great mineral interests of the nation?

The *Enterprise* is also in favor of establishing a permanent association, with local organizations, having corresponding secretaries to keep each other and the parent association apprised of all experiments or discoveries of importance which may come within their knowledge. The plan adopted by agricultural associations, with a slight fee for membership, is suggested; or any plan in fact, which would tend to create a concert of thought and action among the gold and silver miners of the Pacific States and Territories. These suggestions are certainly worthy the careful consideration of the mining public; and if some such plan could be inaugurated and successfully carried out it could hardly fail of proving of vast importance to the mining interest generally.

One immediate object of the proposed convention should, and doubtless would be, to take the necessary steps to place before the next Congress a truthful and intelligent statement of the present condition of our mines, with the view of enabling that body to act intelligently and wisely in the matter of legislating with reference to them. It is a matter almost beyond doubt that Congress will, at its next session, discuss matters connected with the mines, and adopt some course of legislation either with reference to their final disposition or taxation, or both; and also with reference to the establishment of a Mining Bureau, more or less comprehensive in its character. Hence, it becomes miners to look well to their interests, and see to it, that it shall be no fault of theirs, in the way of neglect, to lay before their representatives the proper information on which to base their action, if any "unfriendly legislation" should be made, or any well-meant, but mistaken, action had, by which unnecessary obstacles should be placed in the way of a proper development and the future working of the mines.

The intelligent miners of California and Nevada listened with much interest, last winter, when it was announced that several distinguished Members of Congress would visit this coast during the summer, for the purpose of collecting such information as should lead to intelligent legislation with reference to our mines, and felt a degree of confidence that great good would result therefrom. So far, however, as we have been able to judge from the public speeches of our late visitors, all of whom have spoken more or less freely upon our mining interests, they have by no means succeeded in acquiring a clear and intelligent idea of the condition, necessities, and legislative wants of our mines. So closely were they besieged by petitioners and pleasure-seekers, during their brief sojourn among us, that very little opportunity was given them to acquire that particular information which was supposed to be the main object of their visit. The fault, therefore, has not been so much the fault of our visitors, as of those whose ill-timed, though perhaps well-meant, officiousness, prevented them from coming in direct contact with those only from whom they could have hoped to have derived the information which they needed. The most of our California politicians, even those who have represented us in the National councils, are profoundly ignorant of the necessities and condition of our mines, and are no more fit to direct legislation in those matters than those who have never seen a mine. It is a matter of great importance that this negative, as well as many other positive facts, should be properly laid before Congress. Hopeless of any aid in that direction from the politicians of our own or the Eastern States, we see no way but for the miners themselves—those personally and pecuniarily interested—to put their shoulders to the wheel, and make themselves heard, and their wants known at Washington. We know of no better way to accomplish the desired end than by the proposed Convention; therefore, we heartily endorse the proposition for a Miners' Convention for the Pacific States and Territories, and earnestly recommend the subject to the attention of the interior presses, whose interests are more particularly connected with the mines.

OIL WELL INVENTION.—The latest thing in the oil regions is a new double tubing process—one tube, as now, holding the sucker rods, the other allowing processes for testing the well, permitting the escape of gas, and relieving any sudden extra flow of gas, oil or water.

DR. WINDSHIP, the man who could lift such great weights, we believe 2,500 pounds, recently died at Roxbury, Mass., after a brief illness.

HOME MADE HOSE.

Among the articles exhibited at the Pavilion during the late Fair of the Mechanics' Institute, those interested, and especially miners and firemen, must have noticed the samples of leather hose exhibited by Capt. M. M. Cook & Son, of 801 Battery street. This firm have been engaged in the manufacture of hose, in this city, for the past four years, during which time they have fully established the fact that hose can be made in this city, and from California leather, of a quality fully equal, if not superior, to any which can be imported from the East. They have manufactured this article for the Navy Yard at Mare Island, and for Steam Fire Engine No. 12, of this city, which is pronounced by both equal to the best in use. It stood a test at the Pavilion last year of 175 pounds pressure, without showing the least signs of weakness, and for which they received the first premium; they also received a silver medal for their exhibition the present year, when it was subjected to a pressure of 170 pounds, the highest point which the guage employed would indicate. Messrs. Cook & Son have also supplied a large amount of hose for the Fire Departments of Portland, Salem and the Dalles, in Oregon, from the Chiefs of each of which they have testimonials of the highest character; also from several hydraulic mining companies in this State. They also manufacture a very superior article of horse collars, saddles, etc. They have just received from the East a complete set of machinery and tools, for the manufacture of leather belting, which they will soon be able to turn out in any quantity, and of any desired dimensions. The goods manufactured by the Messrs. Cook & Son are all from California leather, prepared in the most careful and approved manner. We understand that the evidences of the ability of our mechanics to turn out leather work of almost every description, of a quality fully equal to the best received from the East, has now nearly put a complete stop to importation in that line. This fact affords another pleasing evidence of the march of California in her progress towards wealth and independence.

A WINE SPRING, or *something like it*, is said by the Nye County *News* to be the latest discovery over the mountains. According to that paper, Messrs. Wright and Gray, who have been out on a prospecting tour, on their return brought with them a vial filled with a red fluid, tasting and resembling claret wine. This spring is about 120 miles east of here, and Mr. Wright informs us that the flow is about equal to 100 gallons per day. Perhaps they found a "Corner Grocery," with a good run of custom.

LET a man live as long as he will, the first thirty years of his life will always seem the longest, and the daily routine of after years pass like the rounds of a clock, while the hands on the outside and the movements within mark the passage of time to others, till the weights have run down and the pendulum stands still.

A NEW BUSINESS.—There is at this time an agent of English capitalists traveling through the silver mines of Nevada and buying up rich ores for export. He refuses to invest in claims or mills, but will buy all the good ores he can get. He has already purchased one hundred tons in the Columbus district, near Aurora.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Copper Mines and Reduction of Copper Ores.

The reduction of copper ores has agitated the minds of many learned men and capitalists in California—the former to bring their knowledge, the latter their capital to a beneficial account. The value of our copper interests is known to but a very few in the community. In looking through the country we find that nearly or quite every county in this State and Nevada has more or less well defined lodes, and it would be superfluous to describe their locations, formations, etc., as this has been done over and again. That the mines and ores are here, and in abundance, is also an established fact; but the great question to be solved, is

WHAT TO DO WITH THE ORE.

I have almost daily opportunities to be shown and to have an assay made of ores from newly discovered mines, and am continually asked what I consider a mine is worth with ten to twelve per cent ore, or in other words, if they are worth anything at all? Those are questions generally not very easily answered, as the value of a mine depends principally on the distance the ore has to be transported to a shipping port, and other local facilities; and until we have in California all the means at command to reduce our own ores, we shall have to be content with shipping abroad. At least this must be the case so long the smelters abroad give us a reasonable price for the ore; but if they should continue for a while longer to depreciate the value of our ores, as they have been doing of late, we shall be compelled to work them here; for it wont pay to ship at prices much reduced from present rates.

Several efforts have been made in California to smelt the low grade ores; but the undertakings have not, as yet, been very profitable for various reasons, which I will hereafter explain. Miners are at present just as much in doubt as to the value of their mines as when they discovered them; everybody wants to find a solid lode of sulphurets, carbonates, or oxyds, and if they do not find at least twenty per cent. ore their mines are considered worthless. I know of many mines which contain well defined and good lodes, averaging from six to twelve per cent., and the ore not worth working; as one of that grade cannot be taken out and transported to Swansea or Boston, so as to leave a profit to the mine. The question very naturally arises: What shall be done with such mines—are they worth anything or not?

I have carefully read the articles published on this subject in your paper, some time ago, and written by a learned Professor. He gave us an elaborate description of copper smelting, by means of charcoal. The notes given by the Professor are of much practical value; but in some points I think he is in error. He says the cheapest mode of extracting the copper from ores is by smelting, and then goes on and gives us all the expenses connected with reduction and refining, and lastly says concentration by water wont pay. He says he has calculated the costs of concentration, and the figures satisfy him that it will not pay. If the Professor had given us the figures we might be better able to judge of the correctness of his calculations. This is the first point in which I differ from the learned gentleman. I am not a Professor or Doctor, I am only a learner, although I believe I have sufficient knowledge to reduce copper ore by smelting as well as by half a dozen other processes; and I know also by practical experience that copper ores here, as well as in other countries, can be concentrated cheaper by water than by fire.

If the Professor has seen what they call the dressing floors in England and Cornwall, or the dressing works in Germany and Australia, he must surely be convinced that it does not cost as much to crush and concentrate a ton of ore, as it does to smelt it; and that, too, where coal is only worth $1 per ton. At least two-thirds of all the ore smelted in England and Germany, is first concentrated by water and then smelted, and I believe that the people in Europe study their business quite as close as they do here, and they have the advantage of a thousand years of experience. But all this wont satisfy our miners; they want smelting works as the first operation, and if I tell them, a hundred times, don't smelt as long as you can concentrate your ore by water, or sell it for from two to three dollars per unit, they won't listen to me; they think they know better, and go on and build their smelting works. I have several times declined to build smelting works when I have been asked to do so, and refused good pay, because I knew it would be too expensive; and when I have recommended concentration by water they would not listen to me, until by dear bought experience they have learned a lesson.

We have now several smelting works in California; ask the proprietors what they have done and what their profits are, and if they are candid, they will tell you they have lost money. Smelting is a very easy work; but it is not so easily accomplished as it is to melt a bar of lead or silver. The operator has not only to get out a certain quantity of metal, but the value of that depends on the quality of the copper, which can be greatly improved by an experienced smelter. I have seen regulus smelted here in California not much over thirty per cent., the ore of which was yellow sulphurets that had been concentrated, at one fourth the cost of smelting, to a twenty-five per cent. ore. Many miners have but little knowledge of what is meant by concentration by fire or water, and to those who are not acquainted with metallurgical processes, I simply say: concentration by water means nothing more or less than to separate the metal from the gangue or matrix, and get the metal as much as possible concentrated with the least possible loss. In England this is chiefly done by hand labor; in Germany it is done by machinery, and this latter method will have to be adopted by our miners as hand labor is high, and power in most of the mines cheap. It would take too much room in your paper to describe the many and very ingenious machines which have of late years been invented and introduced in Germany, by the application of which machines, ore can be concentrated for six or ten cents per cubic foot.

The only effort of the kind made in California, was at the Keystone mine, in Copperopolis, and these works were imperfect in every way. I told the Superintendent then, a year ago, that the first principle of concentration had been overlooked. The ore should be properly classified first, and then he would be able to concentrate or separate by specific gravity. I did not see a single machine there for which I would give one dollar, if I had to use them; but nevertheless, several thousand dollars have been spent to no purpose, and as any one acquainted with such machinery could have foreseen, it did not pay, and I had to hear repeatedly that the Keystone tried concentration and it proved of no account. But I am sure if the Keystone take their eight per cent. ore, concentrate by proper machinery and let the Union mine go on smelting their eight per cent. ore, that at the end of the year the Keystone will be ahead fifty per cent. in profits over the Union.

In conclusion, I have only to say that I consider a mine with a good lode and eight per cent. ore, in a convenient location, a valuable property.

J. Mosheimer,
Eogineer and Metallurgist.

[Written for the Mining and Scientific Press.]

The Mount Diablo Coal Mines.

Editors Mining and Scientific Press:—California not only possesses her mines of untold wealth in the precious metals, which have attracted hither the inhabitants of every clime, and made her name memorable as the great gold-producing field of the world; but the experience of the past five years has also demonstrated that she holds imbedded within her hills, and within a few miles of navigable waters, immense and inexhaustible fields of coal, the production of which has already tended to lessen the importation of of that article to the extent of thousands of tons yearly, and which is daily increasing. For four years the California Steam Navigation Company have used the Mt. Diablo coal; the same may be said of all the ferries and steamers plying on the Bay, as well as nine-tenths of the stationary engines in this city. It is now exclusively employed for making steam at the sugar refineries, distilleries, woolen mills, flour mills, and in all the foundries; it being considered cheaper for such use than any other coal which can be obtained in San Francisco.

There are now in successful operation four mines—the Black Diamond, Eureka, and the Manhattan—which can supply ten thousand tons per month. Of these, the two first named are the most valuable and extensive. The mines are located in the foot hills of Mt. Diablo, and distant about five miles from New York, the embarcadaro, which is situated at the mouth of the San Joaquin river. The Black Diamond mine lies about a mile west of Somerville, and is separated from those of that place by a high intervening hill. The company was incorporated in June, 1861, and has been steadily employed since. For the past four years, Mr. Benjamin Jones has had the management of the works; and the manner in which he has discharged his duty reflects great credit upon him as a skillful miner and competent superintendent. The coal lands owned by this company comprise some 600 acres, all of which is hilly and broken and unfit for cultivation, but affording good pasturage. A survey has already been made for a railroad which is in contemplation, and ere another year rolls round, it is expected that the iron horse will be transporting his hundred tons per load to the landing. The distance from the mine to the depot on the river, is five and two-fifths miles, with a maximum grade of 255 feet, and an average of 144. The entire cost for a good substantial road, is estimated at $85,000. The engineer, in his report, says: "I have examined the coal tunnels and coal, and am satisfied that when a system of transportation is completed, you can calculate upon hauling five hundred tons daily." At present about 125 tons are being mined, which affords direct employment to about one hundred miners and laborers, besides those engaged in hauling to the landing and boating it to San Francisco. Litigation with the California Mining Company, incorporated by Pioche & Bayerque, has tended to impede the speedy completion of the railroad, which is the only thing necessary to make this one of the most valuable and extensive coal mines on the Pacific coast, as the extent of coal lands owned by the company, together with the natural facilities for working the vein will show at a momentary glance. The company have two mines now in successful operation, each working separate veins; one known as the Clark vein, and the other that of the Black Diamond. In order to strike the Black Diamond vein, a tunnel had to be run through sand rock for a distance of 430 feet, when a vein of pure coal four feet thick was reached. The vein dips from south to north at an angle of 36°. In order to expedite the working, two openings were made, one by driving a slope down on the dip of the vein 140 feet before opening the chambers; and the other by continuing the gangway running with the coal, and which has penetrated to the great distance of 2,150 feet—1,720 being run with the coal and mined as the gangway advances.

As very few of the consumers of the product of the hardy collier can form any idea as to the manner in which it is obtained, a description of the working of the vein may not here be out of place. The miner commences by driving a drift, called a "chute," which is from three to four feet wide, and the depth of the vein for a distance of sixteen feet, which is to leave a substantial pillar between the chamber and gangway, to prevent caving: a chamber, or in miner's *parlance*, breast, is then opened, which is about seven yards wide, and is driven parallel with the gangway. A second chute is then continued in a straight line with the first, and driven a distance of ten feet, when the second breast is opened, which runs parallel with the first, and so on, continuing to leave pillars ten feet thick between each, so as to have a uniformity of work. These pillars are easily mined, as the immense weight tends to crush them; and on the abandonment of the mine they are taken out, so that no coal is lost. Heavy timbers have to be used in the gangway, to prevent caving, and posts are required to be set in the breasts every few feet apart to support the superincumbent weight, after removing the coal. Great care is taken in this work, as it is all important that no cave should occur in the breasts after being worked out, which would prevent the free passage of air through them, and allow the accumulation of black or choke damp, which is poisonous to the lungs, and which would soon drive all the workmen from the mine. In order to get the coal from the breasts after being mined, sheets of thin iron three feet wide by about twelve long, are laid in the bottom of the chutes and through the breasts, and the dip being sufficiently steep, the coal, by its own weight, will go to the bottom, when it is then run into the cars, which hold about three-quarters of a ton each, and then drawn out of the tunnel by a horse, three cars at a time. After being run through the screens, and the dust and pea coal separated, it is then ready for market. A wooden track covered with iron is laid in the tunnel for the cars to run upon. Coal is mined by the yard, and the only tools used by the miner, is the drift-pick, and or iron wedge, and sledge-hammer. A cut is commenced, which is done by undermining the bottom coal about three feet under, and not more than six inches high, so as not to chip up any more coal than is necessary, when each end of the coal undermined is then cut loose from the walls of the vein, and the gad driven into the seam, which is about the middle of the vein, and a mass of coal seven feet long and two thick, comes tumbling under the heavy stroke of the hammer. Great caution must be exercised to keep clear of the falling coal. The gad is then driven in between the roof and remaining seam of coal, which is more easily detached than the lower mass. The coal is then broken up in smaller pieces and thrown into the chutes. The miners have to work in a sitting posture, as the ceiling is only about four feet high, being the thickness of the vein.

Two of the great impediments to mining, are water and the accumulation of foul air; the one is obviated by sinking air-shafts from the surface to intercept the vein, and cause drafts of air to pass through all the breasts, removing the foul air, black damp and smoke from the miners' lamps. While it is necessary to have steam engines at many if not all the neighboring mines, to keep them free from water, a labor which costs thousands of dollars during the year, the water from this mine is kept free by one man working a force-pump.

The coal from the Black Diamond vein, is of a bright black color, much resembling the Liverpool coal, and has a much greater density than that of the Clark vein, which is the only one yet worked by the Union. Eureka and Pittsburg. The Manhattan, after the great cost of running a tunnel 1,050 feet through sand-rock, reached the Black Diamond vein, but at a point where it was not of sufficient thickness to justify working. This coal, for household purposes, will, sooner or later, take the place of foreign coals.

The Black Diamond vein is about 300 feet below that known as the Clark vein, which is about three and a half feet in thickness, and dips from south to north at an angle of 32°. Mr. Jones, in opening this mine, drove down a slope so as to intercept the pitch of the vein, and reached the coal in 147 feet, the slope having nearly the same dip as the vein; a gangway was then run north and south of the slope, so as to enable them to take coal from both ways. These tunnels have reached a distance, one 120 and the other 320 feet from the mouth of the slope. The coal is put in cars, run out on the rail track to the slope by man power, then hitched to a heavy rope and drawn to the top by a horse and whim. About forty tons a day are now being taken from this mine, but the facilities are such that, with an increased working force, 250 tons could be mined daily.

If Mt. Diablo has hitherto failed to produce mines rich in precious metals, she has nevertheless established a reputation of having this great coal producing basin of the State, and we hope the day is not far distant when our people will see the folly of importing an article which she has in inexhaustible quantities in her own native hills, and which can be produced at one-half the cost of that imported. By producing a home supply thousands of dollars, sent out of the State to pay for foreign and Eastern coals, will then be saved, and another drain upon our treasury closed. As yet the coal mines have done but little to advance the pecuniary interests of the owners, the price for which it is sold being but little above the cost of production; but to the State, large benefits have accrued. Several towns have sprung into existence, a railroad in course of construction, another in preparation, to say nothing of the direct employment afforded to several hundred men, by which they not only make a comfortable living, but fair wages besides. A large number of teams are required to haul the coal from the mine to the river, where a number of schooners find steady employment at fair profit in taking it to the city, its final point of destination; and all this is the result of the coal discovery in Mt. Diablo, which is not known probably to one half the coal consumers in San Francisco. A. B.

Patent Safety Can.—Messrs. Perkins and House have invented a can that will protect benzine or any other fluid from the danger of explosion. The principle on which this can operates is similar to that invented by Sir Humphrey Davy, and applied to his celebrated safety lamp.

The creation by the President of a Bureau of Pardons, with an able and fair man at its head, has been recommended, and is now under consideration by him.

Mining Summary.

Mining prospects throughout the State are exceedingly prosperous. In Nevada, Plumas, Calaveras and Amador, in particular, the enterprising miner is reaping a rich reward for his labor, and the result goes to show that the yield of the precious metals is nearly as large, in the aggregate, in proportion to the numbers engaged in searching for them, as it was in the palmiest days of California mining. Whatever falling off may be noticed, is more than compensated by the permanence which that branch of industry has now assumed over that which existed in the flush times, when the virgin placers of the Golden State were first attacked. The developments which are now being made in the deep gravel diggings in Nevada county, are no less astonishing and unexpected than the equally recent and wonderful results which have followed the deeper opening of many of the quartz mines in the same county. We append our usual summary:

CALIFORNIA.

NEVADA.—Rumors are current with regard to the sale of the Eureka mine, "The Emperor's," located at Grass Valley, to capitalists of this city. The sum first named was $500,000, asked, with $450,000, offered. The Oriental Mill, at Nevada, with several ledges, belonging to Mr. J. J. Ott, has been sold, through an agent in this city, to A. T. Stewart, the dry-goods millionaire of New York. The price named is $25,000.

New developments in this county are almost daily reported. We hear that the deep shaft of Scadden, Cliff & Co., at Boston Ravine, is producing specimen gold of extraordinary richness. The *National* says that a little blast was put in a few days since, at a depth of 150 feet, from which about $6,000 was taken, with a plenty more in sight for future operations. The same paper says that the proprietors of the Walsh, Shirtleff and Mather ledge, situated on Slate creek, a mile and a half from town, have struck a ledge three feet thick from which they took out in one day $4,000 in clean gold. They are in good spirits, and think that, if the thing continues to pan out in this way, Allison Ranch will have to look out for its laurels.

The company working the Union Hill ledge have struck the lead at a depth of one hundred and twenty feet, where they find it two and a half feet wide. They have already erected extensive machinery for pumping and hoisting. At the depth of forty feet the rock paid $40 per ton.

From fifty tons of rock from the Shamrock mine, located at Forest Springs, a gold brick was taken a few days since valued at $2,500. This claim is owned by working men, and the rock was taken out at a depth of ten feet.

The Nevada *Transcript* says that a ledge is being opened on Cement Hill, which promises well. A tunnel has been run into the hill and what is supposed to be a stringer, has been struck. The owners expect to strike the main ledge in a day or two. The stringer which they now have is eighteen inches thick. The rock is filled with rich looking sulphurets and will pay, it is thought, about one hundred dollars to the ton. The company will have it tested by crushing, as soon as a sufficient quantity can be taken out for that purpose.

The *Transcript* says that much has been done during the past six months towards developing the quartz interest of Eureka township; several ledges have been prospected with very flattering results. Several quartz mills will be erected there in the spring.

Important developments have been made upon the Blue Lead, north of Greenhorn creek. Clay & Co., are putting up a five mill at Hunt's Hill, to work this cement. This is what is known as the famous "Blue Lead."

SHASTA.—The Highland mill, ten stamps, says the *Courier*, has cleaned up a run of sixty-six hours, with the result, as per assay by Messrs. Lewin & Co., of $3,398.42. The company have two hundred and fifty tons of the same kind of rock already out.

PLUMAS.—We learn from the Quincy *Union* that Messrs. Bolinger & Blood's smelting works, in Genesee Valley, are in full blast, and are smelting a large quantity of ore. They will commence shipping merchantable copper in a short time. Messrs. Shelton & Co., have a number of men employed upon their works. They will soon be ready to commence smelting.

Miles & Hollingsworth have purchased the Mount Pleasant water ditch for the sum of $3,000. The Cresent mills are not running at present, owing to repairs being made in the mill. The machinery, engine, etc., for their new mill, was shipped from Marysville some time since. The company will have both mills in running order in a few weeks.

We learn that the Mammoth company, at Jamison, are taking out some very good paying quartz from their ledge.

PLACER.—According to the Placer *Herald*, a renewed interest is beginning to be manifested in Placer county, with reference to mining. The great success attending that branch of industry in Nevada and Amador appears to be the stimulating agent.

On the Green Emigrant ledge, the same that furnished such rich rock last winter, a new discovery was made a few days since, on a different portion of the vein, of quartz spotted with free gold.

A shaft is down on the lead of the Wells company, forty feet, the rock looking well, and several tons sent to mill crushed at Grass Valley, show returns that justify a prosecution of the work.

Capt. Mallett, of Virginia City, Nevada, who has been prospecting on North Ravine, one and a half miles west of Auburn, has struck a vein of quartz two feet in thickness, at the depth of thirty feet, that shows well in *silver sulphurets* and gold. The Captain thinks he has "struck it," and the present showing is certainly encouraging. As he is an old miner he believes in getting into the earth's bowels to demonstrate the value of a lead, and continues work upon his shaft night and day.

AMADOR.—Quartz mining, says the Amador *Ledger*, has assumed that importance in that county which it deserves, and that was long ago predicted. Since last Spring seven new mills have been erected, and a large number of stamps and machinery added to old ones. Over thirty new lodes have been opened up that we have a personal knowledge of. Most of them have been sufficiently tested to prove them good, and several have sold at prices ranging from three to twelve thousand dollars. The sales of developed mines within the past seven months exceed half a million dollars. With but one exception these sales have all been made to California capitalists, and for gold. But the most interesting of all this, is the fact that the greater part of this money has fallen into the hands of men who will use it in developing new mines. Another result is, that under such stimulus, hundreds of miners are now hard at work prospecting, who, during the dry season, heretofore, have been idle, or, at most, only working for grub in placer mines. Now that there is a chance for disposing of quartz lodes that prospect well, every exertion is made to discover them, and with such success that all express astonishment that so many rich mines should have lain for years unnoticed. * * * In several of our mining districts it is almost impossible to get custom work done; what mills there are being used only for crushing from lodes on which they are built. If a good custom-work mill were erected in each of the several mining localities in the county, it would not only greatly facilitate the development of the mines, but would be a most profitable investment to the owners of the mills.

Of copper mining, the *Ledger* says that after having gone down from a fever heat to zero, it is gradually assuming a healthy condition. The Newton, Cosumnes, Oriental, Aroyo Seco and several others have been fully established as paying mines. The Aroyo Seco, better known as the McNeely mine, near Ione City, with one exception, has paid all assessments for sinking shaft and improvements. The returns from ore shipped to Swansea are sufficiently favorable to justify the owners in largely extending their future operations.

CALAVERAS.—According to the *Courier*, Copperopolis, at the present time, presents quite a lively appearance; a large amount of building is going on. The copper teams, some containing sixteen horses, are constantly arriving and departing. The new engine-house on the Keystone claim will soon be completed. It is expected the engine will be in running order by the 10th of October. The smelting works of C. T. Meader are in full blast, and seem to be doing well. The total amount of shipments from the Union mine alone, for the week ending Saturday, Sept. 21, was 807 tons. We find no mention made of the amount shipped by other companies; but the following extract from the Stockton *Independent* shows that the business of shipping ore through that city is rapidly increasing: "The copper trade of Stockton is of such importance that, in addition to what is carried as freight by the regular steamers, the Navigation Company now keep the steamer Helen Hensley and the barges Sacramento and J. Bragdon exclusively employed in the transportation of copper ore."

It is said that the Rawhide Ranch claim, located near Copperopolis, has been sold to a company of capitalists for the sum of $50,000.

WASHOE.

The mining interest in and around Virginia City and Gold Hill appears to be decidedly improving. The scarcity of ore complained of recently by the mill men is not now felt, and, as a consequence, the mills are now more generally at work, and affording an increased employment for labor.

The chief feature of last week was the starting of the Yellow Jacket mill at Empire City, which was attended with considerable ceremony. The construction of this mill was commenced about a year ago, as a private enterprise, by James Morgan, Esq. He subsequently disposed of the work to the Yellow Jacket Company; but continued to superintend the construction. The crushing capacity of the mill is estimated at 100 tons daily. It contains eight batteries, of five stamps each—one-half weighing 1,050 lbs each, and the other half 750. The mill is described as one of very superior construction. Its chief feature is a divided motive power. The crushing machinery is run by water-power, while the amalgamaters are driven by steam. The engine is of the Corliss pattern, and 150 horse-power at its ordinary capacity. Everything went off finely at the start. The machinery has been erected under the supervision of Alex. Stegar, who will continue in charge. The reduction works will be managed by Mr. Neary, while John B. Winters will act as general superintendent of mill and mine. The new shaft of this mine is now down 370 feet, and still progressing. At the depth of 400 feet the new shaft will be connected by a drift with the old workings on the north. About 200 tons of ore are now being raised daily, which amount will soon be increased to 300, giving a large amount of work for custom mills. The affairs of this company are now in a decidedly prosperous condition.

The Gould & Curry croppings are now being worked with much success. The ore is said to be good, and will pay an average of $150 to the ton. Free gold is visible in a large proportion of the rock, beside any amount of blue sulphuret ore. It turns out richer than was anticipated, and it seems strange that more of these croppings were not worked in 1860. It is the intention to work the croppings from where the cave at the surface occurred last winter, for the distance of some 200 yards to the northward. The pay streak will average 20 feet in width, and will extend to the depth of 175 feet, or to where the ledge has been worked underneath. It will probably take a year and a half to work this out. Meanwhile other developments may reasonably be expected at the lower level, where a fine body of excellent ore already exists, the depth of which is unknown, but which will be ascertained and developed by the Bonner shaft which is being sunk on D street. Much of the ore from these croppings will work some $500 to the ton, although the average will not go over $150. The good pay found in these croppings only goes to prove the fact that really good mines will show for themselves at the surface, which if not the case, it does not follow that a ledge will pay by being sunk on.

The Belcher company are at present engaged in running two drifts from their main shaft to their lead; one at the depth of 500 feet. They expect to find rich and extensive deposits of ore in their new levels, also much water, but then they are well fixed for pumping.

A deposit of first-rate ore, about 15 feet in width, has been found in the lower level of the Savage mine. Some splendid ore is also being found in the old North Potosi chimney.

In the fourth level of the Eclipse mine a body of very rich ore has just been struck, the extent of which is unknown; but it promises to hold out well. It was struck in sinking a prospecting shaft.

The drift from the Ophir-Mexican shaft tapped the large body of water in the old shaft of the Ophir, a few days since, upon which the water rose in the shaft first mentioned to the hight of 150 feet, but the large and powerful pump being brought into action, the water was soon reduced to less than a hundred feet, and is probably all out by this time.

Major J. C. Ridge has been appointed manager of the affairs of the Washoe United Consolidated Gold and Silver Mining Company, in place of Col. Wm. S. O'Conner, resigned. Major Ridge is well spoken of by those acquainted with him, and will doubtless do what is best for the interests of the company.

The difficulties so long existing between the Ophir and Burning Moscow companies have at last been settled, but is not yet made public. It is presumed, however, that upon what basis it has been effected, by the Ophir obtaining a controlling interest in the Moscow. This arrangement settles the difficulties, and chokes off the lawsuit between the companies, but does not decide the great "one ledge" theory.

It is said that there is not at present a single claim worked in Palmyra district, and that the town of "Como" is dead, and pretty much deserted. Hopes are entertained by many of a revival at some future day—perhaps when the great Overland Railroad gets across the mountains—who knows what that may not do in the development of what are now worthless claims? The Frankfort claim, situated just north of Palmyra, in Indian Springs district, is in active process of development under the superintendence of J. B. Billiard, with fair prospects of success. This claim is located about half a mile down a ravine from the famous Whitmore ledge.

According to the Nye County *News*, 1,450 ounces of bullion were recently shipped from the Pioneer mill (five stamps) in one week. The *News* promises to publish a weekly report of shipments from this mill, the only one in operation in the district.

The editor of the Monitor *Gazette* has seen the deed of conveyance of the Am. Con. Mining Co. to the American Mining Co. of New York, for the consideration of $10 000. The Superintendent of this last named company has recently arrived, and taken charge of the works.

Work will be started immediately on the shaft of the Morning Star Co., for the purpose of opening another level from which to take out ore before that on the present level is exhausted.

The work of putting in the dam and excavating for the race upon the mill site of the Monitor Consolidated Company, has commenced.

The affairs of the Santa Eulalia Company are assuming shape and comeliness again.

The Buckeye Company have commenced a large working shaft, to be continued down to good paying ore.

The *Gazette* says that the mining prospects of Alpine grow daily brighter and brighter. Paying mines are demonstrated to the satisfaction of the most sceptical, and investigation and attention is being attracted to others not yet open, but presenting all the indications to justify hope and induce the expenditure of capital. Capital is actually coming in and taking hold, and we expect to see one or two new mills taking out bullion from Monitor before the first of January next, and that such a number of claims will be worked and prospected during the winter as to demand several first class mills early next spring. Both our present mills have been running during the week, but we are unable to give the returns of bullion, as they each took Saturday for their clean-up, and as we go to press no return has been made.

HUMBOLDT.

We have before us, in the columns of the Humboldt *Register* and Gold Hill *News*, very full reports of the progress of the mining interest in Humboldt county.

From a correspondent of the *News*, we learn that the work on the Montezuma mine is progressing most energetically and satisfactorily. The vein is improving in width and quality as the workmen go down. The amount of ore is apparently without limit. That which is being taken out is being crushed at Webber's mill. Fifteen bars of bullion were the result of the first crushing of three tons—value not known, but perfectly satisfactory at sight.

The Montana claim is also being energetically worked. The ore from the start was of such a quality that the proprietors determined upon the erection of a mill, which is now completed and running, and known as the Stevenson mill. It is furnished with ten of Varney's pans. The mill has just been started, and although no clean-up had been at the latest dates, the result was entirely satisfactory.

The *Register* says that much reserve is maintained with regard to the working of the De Soto; but infers that everything is perfectly satisfactory to those who have the inside track.

The Manitowoe ledge, so much prospected for, seems at last to be hunted down. Three drifts have been run, at different altitudes, into the mountain; and they have the regular Manitowoc rock in each; and are getting it out in quantity to keep the mill constantly employed.

The American Basin Company are pushing work vigorously. The company has purchased the mill at the upper end of Star Canon, and intends to remodel and put it in good working order. One new feature will be a Turbine wheel, which will be propelled by a fall of nearly two hundred feet of all the water in Star creek. The wheel is to be twelve feet in diameter, which will give an abundance of power for all the machinery.

Work on the Yankee is progressing finely. Messrs. Mathews and Canning are rushing things; assisted by J. B. Allebaugh in the blacksmith shop.

REESE RIVER.—We have numerous "clippings" from the *Reveille*; but our "summary" has already quite filled the fullest space allotted to it; and we must reserve further mention of this district until next week. Our Reese River correspondent "J. M." will soon be at his post again, when we hope to hear more direct from this interesting and important locality.

SALES OF THE WEEK

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board

SAN FRANCISCO, SATURDAY MORNING, September 30th, 1865.

The competition among money lenders, growing out of the accumulation of capital, has induced the leading banking institution of this city to announce that the rate of discount hereafter, on first-class business paper or satisfactory collaterals, will be *one per cent. per month*. This decline in the rates of interest has been anticipated for some time past, and will exert a stimulating influence upon many interests in this city and throughout the interior. It is not only an evidence of the faith capitalists have in the permaneucy and safety of all our interests, but shows that there is abundance of means at hand for the prosecution of every legitimate enterprise, and may be accepted as a sure barbinger of our future prosperity.

Receipts of treasure from domestic sources, since the date of our last referenee, exceeded one million dollars, making an aggregate of some four millions during the current month.

A good demand for bullion is likely to prevail in a day or two, but the rate has thus far shown little or no variation from last week, and sales of gold bars were made yesterday at 850@860 for average grades. Silver bars may be quoted at par to ½ ℔ cent. premium for round lots.

Legal Tender Notes have been steadily maintained within a range of 73⅞@74¼c, closing at 73¾c. bid. Our latest telegraphic advices from New York, quote gold at about 144.

A much better feeling has pervaded in the Sbare Market this week, and nearly all prominent stocks were actively dealt in. Recent developments in portions of the Comstoek lode are regarded with much favor, and the fears entertained by some as to its poverty at a certain depth, seem to have given place to rather different views, and there are tbose who now think that a degree of wealth will soon be disclosed not calculated upon at any former period. With regard to tbe condition and future prospects of a claim largely dealt in last week, and which is still an object of interest to many dealers, it is stated that influential parties have been enlisted to give an undue coloring to reports from the mine, and some stockholders who have acted upon information received through these channels, now find that they were misled, and have been induced to part with their stock at a sacrifice. On the other hand, it is asserted that there were good reasons for the panic of last week, and that the recent advance would not have taken placo but for the favorable disclosures made within the past few days. The monster shaft to be sunk to a depth of 1,200 feet by the Alpha, Imperial, Empire and Baeon Companies, will involve an expenditure of some $2,500 per month, by each eompany, to be completed within 12 months, at an nggregate cost of about $120,000.

Alpha is in better favor, and sales were made at $2,250, closing at $2,250 nzked. This company has been reincorporated into 5,570 shares, of $100 each—20 sbares per foot of 278½ feet. Advices from tbe mine continne favorable, and in running fifty feet south from the inclue, at a depth of about 540 feet, a body of fine ore, 25 feet in width, has been disclosed. Receipts of bullion this month will, it is said, exceed $90,000, and the only liabilities of the company now existing, are the monthly installmeuts due for the recent purchase of their mill, upon which $32,000 has already been paid.

Yellow Jaeket has fluctuated but little, and 144 feet were dealt in, within the range of $1,410@1,345, closing at $1,345. During the week ending September 18 1,307 tons of oro were extracted from he mine, and 1,141 tons were reduced, yielding an aggregate of $37 121.70, or an average of $32.53 per ton. Siuking has begun upon th west pay strata, from the 360 feet level, and a mass of good ore h been met with thus far. The east body also looks well at a depth 440 feet. The Morgan Mill is said to be in fine condition, and rnnnin up to its full capacity.

Savage was sold to the extent of 30 feet, at $1,200@1,225, closin at $1,240 asked. The lower drift running east continues in good or and the west body above is said to hold out well.

Gould & Curry fell from $1,250 to $1,200, rose to $1,285, then sol at $1,275, and closes at $1,250 nsked. The product of this mine i fully up to the average of the past few months, nnd receipts of bullio for September will amount to about $175,000.

Crown Point is less active, and small sales were mnde at $1,170@ 1,120, closing at $1,130. A large body of water in the 300-feet leve interferes, temporarily, with the progress of the drift at this depth Beleher has been steady at $890@875.

Hale & Norcross has attraeted considerable attention, and 260 fee changed hands, opening nt $520, ndvancing to $680, dropping to $66 rising to $860, aud closing yesterday at $750. In sinking from th 535 feet level, at a depth of nearly 65 feet, good ore has bee met with since Snnday last, and the present charaeter of this deposi would seem to warrant its continuance at a still greater depth. I drifting soutb and west from the incline, at a depth of 700 feet, a de posit of pay ore has also been found this week, and it is supposed tha that this body is a portion of the same just found above.

Ophir has been active and nearly 200 feet were sold, declining fro $435 to $370, and ebanging hands yesterday at $340@320, s. 30. We ar informed that a final settlement has been made with the Burning Mos cow company, but the details are withheld at present. It is believed bowever, that about two-thirds of the stoek of the latter has been sol to the Ophir Company. In this case the Moseow Compnny will prob ably cease to exist, being disincorporated or merged into the Ophir.

Chollar is in better request and large sales were made, steadily ad vancing from $420 to $485, dropping to $455, rallying to $500, an selling yesterday at $512½@500. At these rates 347 feet changec hands. Potosi has shared in tbis improvement, advancing from $40 to 460, then selling at $495 and closing nt $472½. Between tbe 3d an 4th galleries of this mine a considerable body of ore has been found recently, and near the top of the old works the east and west drift are said to look promising. On the east wall, near the north lius an upon a level with "stope B," some ore has also been met with.

Empire Mill has been in much less favor, declining from $330 pe share to $250, buyer 30, and selling yesterday at $220@225. Th lower drift is not yet in ore, and to this unfavorable feature the present depression of the stock is mainly attributable. There will be no divi dend for the month of September. Overman improved slightly, rising from $165 to $185, and closing at about $175.

Imperial has been subjected to a continuation of the "bear" pres sure inangurated last week, but has been tolerably well maintained The aggregate *sales* (?) amounted to some 1,100 shares, within a range of $230@240, closing nt $232. The different bodies of ore in tbe 6th level continue to improve. On the south side of the main drift, a width of 40 feet has been "breasted out," and the ore limit not yet reacbed. Work has progressed south 25 feet, and the ore at that point is said to be better than at the drift line. Throughout the drift north (a distance of 20 feet) fair ore is also obtained. Receipts of bullion since the 10th inst., including cash surplus then on hand, amount to some $65,000, and for the entire month will not vary materially from our estimate of last week. The usual dividend is anticipated for the month of September.

Bullion has been dealt in at $125@126. Daney fell from $40 to $35 and closed at $35. Sierra Nevada fell from $22½ to $17, and sold yesterday at $17. Exchequer was sold at 27½@25, closing at $26 and Lady Bryan was dealt in at $7½@8½.

The recorded sales of Stoeks, since Saturday last inclnsive, amounted in the aggregate to $1,200,049,

ARNOLD'S DESULPHURIZING PROCESS.—A correspondent of the Humboldt *Register* says that Mr. Olds, agent for Arnold's Decomposing Desulphurizing and Disintegratiog Process for working argentiferous, auriferous, arsenical and Tellurical ores, is experimenting with some of the Humboldt rock. This process is conducted substaptially as follows: The rock is heated to a red heat, then submerged in a chemical solution, wherein is contained the great secret. This softens the hardest kind of rock so that it can be crushed between the fingers; and it is claimed by the inventor that it also separates all the base metals from the precious, and greatly facilitates the process of amalgamation. He is now operatiog on a half ton of DeSoto ore, which he is workiog at the American Basin Company's mill. This process is entirely new. Mr. Olds is selling the right to use it, also the process of preparing the chemical solution, which he says costs but a trifle.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. It is expected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and Inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we examine thoroughly the investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications filed in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, the equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, U.S.A. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 years and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On every appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose surest course is to employ their business with the active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

Mechanical.

THE FOUNDRIES AT SACRAMENTO.

The Union Iron Works of Williams, Heilbron & Co, situated on Front street, between N and O streets, are briskly employed on jobbing and repair work. Under the liberal management of its enterprising proprietors, and the competent foremanship of Homer F. Root, recently of San Francisco, the establishment is substantially advancing in business and popularity. We are pleased to note this well-deserved success.

At the Sacramento Iron Works of Goss & Lombard, is building for the Savage Company, Virginia City, one of the largest and finest steam engines ever ordered for mining purposes in this or any other portion of the world. This engine is accompanied with a powerful pump and hoisting gear. It is one of Corliss' patent 26-inch cylinder, and 6-ft. stroke; shaft, 18 feet ameter, weighs 18 tons; mortised gear for running pump, measures 10 feet in diameter, is 16 inch face, and weighs 7¾ tons; pinion wheel, 16-inch face, 4-inch pitch, and 38 inches diameter. The immense iron bed plate, cast in two pieces, weighing 13 tons, and the ornamental columns, 17 ft. high, supporting the beam, give the spectator an idea of the ponderous proportions of the magnificent structure. The total weight of the engine, aside from the pump and gearing, will amount to over 70 tons. The pump is 14 inches in diameter, with 7 feet stroke. The drum for hoisting is constructed for flat wire rope. The work on this machinery appears most excellent, and we understand is being done by time.

There is also building at these works: one 18-inch cylinder engine, 36-inch stroke, Corliss' patent, for a Reese River company; two ditto 14-inch cylinder, and 30-inch stroke, for Atlantic and Pacific, and New York and Ione mining companies, Reese River; one slide valve engine, 16-inch cylinder and 36-inch stroke, with hoisting gear to work by link motion, for the Heywood & Chamberlin mine, Sutter Creek, Amador county; six settlers, 7 feet in diameter, constructed with sheet-iron rim 16 inches high; twelve pans, 4 feet in diameter, to be finished with wooden rims 2 feet high, for the Atlantic and Pacific Co.; one 12-inch engine, with hoisting gear, for the Empire Co., Grass Valley; another engine, 12-inch cylinder, 24-inch stroke, with pump and hoisting gear, for Burdett Co., Grass Valley. A large amount of repairing is done at this establishment for the Central Pacific R. R. The works were established in 1853. Mr. Horace Adams is the popular foreman of these works.

Mechanical business in Sacramento seems to be highly prosperous at this time. Besides the works above mentioned, are several boiler shops and shutter manufacturing shops in full rattle.

To be Tested Practically.—We understand that Mr. Bruckner, of this city, has sold the rotary desulphurizing furnace, which has been on exhibition at the Pavilion, to a New York company, who will put it up at their mines in the Blind Spring district, Esmeralda. We also notice that another furnace of similar description is being put up on a mine at Reese River. A rotary desulphurising furnace, or rather set of furnaces, is also about going into operation at some point in Reese River or the Humboldt country, this last being the Crosby & Thompson patent, from which much is expected, and which is said to be already in successful operation at Pike's Peak. We are pleased to note these practical efforts at improving upon the old reverberatory hearths, and shall be pleased to note the success which may attend any or all such experiments. That they will succeed we have but little doubt; and in so doing they cannot fail to effect a vast saving in the expensive and tedious process heretofore employed.

Russia will eventually become one of the largest purchasers of American machinery of all kinds. Skilled labor and good machinery will advance the development of her resources, and there will be a steadily increasing demand for years to come for mechanical and agricultural implements.

A Novelty in Mechanics.—The Chicago *Tribune* notices at the Vulcan Iron Works, in that city, a new form of steam engine, the invention of Mr. E. Danforth, which appears to be one of the greatest novelties in mechanics of the present age. The great feature is the substitution of a "generator," of the form of an oblate spheroid, for the flue boiler hitherto in use, by which it is claimed five important advantages are gained over the old system, viz: positive security against explosion, a decrease of at least one-half in expense, a saving of one-quarter in fuel, and great economy in space occupied and in freight. As far as it is possible to judge from a single visit to it when at work, Mr. Danforth's engine does accomplish these desirable ends. The "generator" spoken of is thirty inches in diameter and three inches in thickness. When it is brought to a high heat water is jetted into it and instantly converted into steam which passes into use as in any engine employing the ordinary flue boiler. The water does not touch the iron of the generator, but, scattered into spray as it passes through the sprinkler-like end of the pump at once becomes steam in an intensely heated chamber. This steam being super-heated gives a power three times as great as that produced from the ordinary boiler. The engine now at work is a horizontal one, with a cylinder of but five inches diameter, with eight-inch stroke, but with the super-heated steam employed, is calculated to have fifteen horse power. The guage indicated 100 pounds pressure, but the engine has been run at 160 pounds. As the generator is capable of bearing a strain of 3,000 pounds, there is absolutely no danger of explosion. The entire weight of engine and generator is but one and a half tons, while an engine with flue boiler, having the same power, would weigh three and a half tons. This power is employed in driving one of Foreman's "iron clad burr stone" mills, which was grinding corn at the rate of twenty bushels per hour.

Novel Application of Iron.—Mr. James Atkins, of the well-known firm of R. W. Winfield & Co., of Birmingham, has, it appears, succeeded in effecting a very important improvement in the manufacture of articles which are, or might be, made of brass, copper, or other similar metals. It is well known that many ornamental and other articles produced in brass, copper, and such like metals, are first made with hollow interiors, which are then filled with metallic substances, such as lead, in order that the articles may possess considerable strength and stability. Of this character are some of the ornamental parts of iron bedsteads, counterbalance weights for gaseliers, statuettes, and so forth; the ordinary mode of operation being to pour molten lead into the interior of the article; the new method, however, dispenses with the use of lead, and substitutes for it molten iron. Now, as brass, copper, and other analogous metals, melt at a much lower temperature than iron, it is evident that they must first undergo some very peculiar treatment, in order that when the molten iron is introduced within articles made of those or kindred substances, they may not be melted and destroyed; and this is said to be fully guarded against and effectually provided for. The invention has been patented, and we hope shortly to be able to afford our readers full particulars of the process and mode of operation.—*London Mining Journal.*

An Oregon Invention.—The *Oregonian* says: "Mr. J. M. Howe, who is now in New York, has succeeded in getting a patent for his invention for the manufacture of wheels for vehicles, boring felloes and sawing them to the correct level, tenoning the spokes at both ends, sawing them to the required length, and planing the felloes simultaneously at three sides, and for planing and moulding other articles or work."

Strikes.—The lamentable results of strikes are forcibly shown by the fact that the loss sustained by workmen in Staffordshire alone during the recent conflict between the masters and their hands is estimated at five hundred thousand pounds.

A Natural Ice House.—In the town of Greenwood, Maine, is a natural ice-house, where ice keeps the year round. The cave is pitch dark, compelling persons who visit it to carry torches. It is only about two years since this cool retreat was discovered.

Lake Superior mines are quite profitable. The Quincy mine gave, in June, one hundred and thirty-one tons, and the Franklin mine eighty-five tons.

A French gentleman claims to have discovered that wines may be much improved by gently warming them, and that "sick" wines may be cured by the same process.

The important fact has been ascertained that there are four hundred thousand feathers on the wing of a silk worm moth.

Extracting Hydro-Carbon Oils — Important Improvement.

In manufacturing oil from coal or other bituminous substances by destructive distillation, it is of the utmost importance that the distillation should take place with a low and even temperature, barely sufficient to develop the oleaginous vapors, while a too high degree of heat converts a portion of the oily vapors into permanent gases, thus diminishing and deteriorating the product. The rotary retort has been found most suitable for the purpose, making distillation practicable with a less degree of heat than must be used with a stationary retort. But in using the revolving retort it will be found that the residuum of the bitumen or material used leaves a coating on the interior sides of the retort, which coating gradually increases with every charge, and being a poor conductor of heat, makes a higher exterior temperature necessary with every charge, while a portion of the oily matter remains on the coating, and is there burned and converted into permanent gases. In order to get the best and largest product from the material used, it will, therefore, be found necessary to clean the retort for every charge, which in the ordinary way can be done only when the retort is cooled down, so as to permit a person to enter it. Mr. C. S. Lundborg, of Sodertelje, Sweden, proposes thus to prevent or greatly diminish the cooling alluded to, so that a great number of charges may be run without any cleaning or stopping the work, while at the same time a much larger yield and a better quality of oil is obtained, and the heat is distributed more equally in the retort. He obtains the desired result of keeping down the coating and distributing the heat by introducing a certain quantity of pieces of iron or hard stones with the coal or bitumen into the retort. The loose iron or stone will by its specific gravity follow the bottom of the retort (which may be ribbed in the interior surface) during its revolutions, rapidly acquiring the temperature of the surrounding surface exposed to the fire, and being mixed with the coal or bitumen, which by the rolling action of the pieces of iron or hard stones is crushed into small fragments, the heat is diffused more equally through the mass, and the adherence of the coating before alluded to almost prevented. The yield of oil by this process is much increased, and its quality greatly improved. He uses pieces of iron or granite stones, weighing from one to five pounds each, and puts generally about two hundred weight to a charge of 2,000 pounds of coal. The quantity of loose iron or stones used, or the weight of the separate pieces, may, however, be more or less, according to the nature of the coal or bituminous material used, and he does not see any reason why pieces of some other metal than iron, or any other kind of hard and heavy substances, may not suit equally well.

How Rain is Produced.—An elevation of temperature is followed by an evaporation of water into the air, but the process is comparatively slow, and it is a long time before the air is fully saturated. So, also when the air is saturated, a depression of temperature is followed by the condensation of a portion of the vapor into rain, but the mass of the atmosphere tempers the abruptness of the transition. The vapor condenses first into vesicles, or minute hollow bubbles of water, so light that they float in the atmosphere; and when these bubbles break and the drops of rain fall, they are wafted down so slowly through the resisting medium that the "soft falling snow and the diffusive rain" have become fit emblems of the beneficence of God as they give the strongest evidence of his wisdom and skill. Moreover, the glorious clouds which add so much beauty to the landscape, and typify, in their virgin whiteness, the purity of heaven, are collections of these vesicles of water floating in the upper atmosphere which surrounds it. The heated air from the tropics, heavily charged with moisture, is continually moving toward the colder regions, both of the north and of the south; and as the aerial current thus becomes chilled the vapor is slowly condensed, and the water showered down in fertilizing rains on the land. Thus it is that those beautiful provisions which we see in the rain all depend on the presence of the air, and result from a careful adjustment of the properties of aqueous vapor to the exact density of our atmosphere.—*Cassell's Illustrated Family Paper.*

Brazil.—The discovery of kerosene in the Province of Jujny, Brazil, promises to be a great thing for that country. Already kerosene lamps are replacing the old oil lamps, and one Lenardo Bella has applied for a patent for working the petroleum springs.

The British aristocrats are on a strike They have determined next season to abstain from attending any of the Queen's drawing rooms or levees held by proxy, and not to visit them until they are received by the sovereign in person.

New York Millionaires.—Wm. B. Astor is sixty-five years old, worth fifty millions, a round face, pleasant, quiet-mannered gentleman, owns two thousand dwellings, and is a lenient landlord. A. T. Stewart is sixty, thin, nervous, dignified, worth thirty millions, and liberal in cases of benevolence that appeal to his sympathies. Commodore Vanderbilt is white-haired, red-cheeked, worth forty millions, drives a fast horse, keeps a boat, controls two fast railroads, companies with fast men, and gives away his money very lavishly. August Belmont owns twenty millions, coarse, stout, and very German. George Opdyke, five millions, fifty, but looks younger, an agreeable gentleman. James Gordon Bennett, five millions, seventy-three years old, dignified in manner, broad Scotch accent, benevolent to the poor.

The last of the Government loan has been taken. The whole amount authorized by Congress—six hundred million dollars—has now, to a very great extent, passed into the hands of the American people and no further loans will be put upon the market, at least not until the next session of Congress. If any evidence were required to show the confidence entertained by the people in the stability of the Union, the fact that they have become its creditors for so large an amount would be indubitable proof. Although the Union was in debt to the extent of three billion dollars, the people, when invited to subscribe for the six hundred million loan, promptly advanced the amount, with unfaltering confidence.

Russian Gold Mines.—The Russian Government has lately quit the working of its gold mines in the Ural mountains, and has arranged for them to be worked by private enterprise. The results of this change have been very remarkable. The quantity of metal extracted is now increased ten fold. Large districts which had been abandoned as not worth the cost of working are now working at a large profit. The adventurers have also made considerable sums by granting working rights to other persons. The experience of Russia should have much weight in determining the question now being agitated for the sale of our own mines.

Colorado Knocks for Admission.—The people of Colorado Territory have formed a State constitution. It was adopted by the convention on the 12th of August, and was submitted to a vote of the people on the 5th instant. Whether they have affirmed or rejected it we do not know, but at all events in a few months Colorado will doubtless knock for admission into the Union.

The Panama Steam Fleet.—A late number of the Panama *Star* says: We have thirty-three first-class steamships, most of them quite new, grossing nearly sixty-five thousand tons, and all kept constantly running to and from the Isthmus, and paying better dividends than any other lines in the world; and yet we find writers abroad stating that the Panama Railroad has brought no trade to the Isthmus.

Over 600 sea-going vessels belonging to citizens of the United States, have been sold to subjects of Great Britian during the war. Men of other countries have also bought American ships in large numbers, and it is estimated that a thousand vessels have been transferred in all.

Dreadful.—At Oneida, New York, a farmer who was using a mowing machine suddenly came upon his little daughter, who was asleep in the grass, and before he could stop the horses, the horrid scythes cut the little thing's legs off.

A lump of pure gold, weighing six pounds, was picked up a few weeks since by a poor boy who was fishing on a creek near New Virginia, a small village in Clark county, Iowa. The finder was offered $1,500 for the treasure, which he refused. He refused to point out the exact locality where it was found.

A Stockton Patent.—The grain-sowing machine taken to San Francisco yesterday on the Cornelia, is a Stockton invention, patented by Ingalls and contrived by W. Root of this city. It works to perfection, and sows about fifty acres of grain per day. In working it is attached to a wagon loaded with grain, from which it is fed.—*Independent.*

The possibility of tin being found on the north shore of Lake Superior is very great, as the formation is said to be exactly that of the tin region of Cornwall, England. For that matter, there is the same possibility of the discovery of tin in the silverlead region between Houghton and Marquette, the rocks being highly favorable for its occurrence.

The West Virginians are jubilating over the first discovery of desulphurated coal in that region, the long time desideratum for their furnaces. It is found in an eight feet vein, near Bridgeport, on the Ohio.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Sept. 30, 1865.

THE PETROLEUM INTEREST.

Matters at the Union Mattole well, Humboldt county, though moving somewhat slow, are nevertheless going on quite satisfactorily to the company. This company has now demonstrated, beyond the possibility of a doubt, that we have a paying, pumping oil well at Mattole. What has been done has proved to the satisfaction of all concerned that the company's well, whenever the necessary facilities for transportation can be made available, can be made to pay a profit of fully $50 per day, over all expenses; and that there is a ready market in this city for all the oil that can be produced. It is also a very generally conceded probability, among those who are acquainted with such operations, that the well now being worked will drain but a very limited tract of ground; and that consequently a large number of wells may be sunk to a profit, at intervals throughout the entire extent of the claim. This advantage will probably hold good with regard to nearly all the different claims in that region, wherever petroleum may be found in pumping quantities. The reports from the progressive wells are still highly favorable. An article will be found in another column, giving some farther details of several local operations now in progress in the vicinity of the Union Mattole. Intelligence of important developments at the Paragon well are looked for by the return of the Del Norte.

PETROLEUM AT THE EAST.

Petroleum matters at the East appear to be moving along very quietly. Many of the wells which were among the earliest opened are diminishing in their flow, and some have altogether ceased to yield oil. Such a result, only, could be reasonably expected. Petroleum is not like water, constantly renewing its reservoirs by vaporization and subsequent rains. The process of the formation of oil may possibly be, and probably is still going on; but by such imperceptible degrees as not to be appreciable. The supply is obtained from subterranean reservoirs, of limited extent, and from the seepage from such rocks, as in long periods of time have become saturated with the oleaginous liquid, which has filled their pores and crevices. Spouting wells are fed mainly from reservoirs, the oil being forced to the surface by the pressure of gas; when that pressure is removed, as it soon will be by exhaustion, the wells cease to flow; but such wells, by proper management, may generally be made profitable by pumping, for a still longer period.

SPOUTING WELLS IN CALIFORNIA.

Spouting wells will probably be rare in California, if found at all. The greater disturbance of the oil deposits here, has afforded a comparatively free vent for the escape of the gas. If found at all, they will be met with under horizontal strata, or where the strata forms an anticlinal axis, with but slight inclination. If they are ever found in Humboldt county, it will be at some point in or north of the Eel river valley. It seems a wise provision of Providence, that whatever was stored up in the early ages of the earth, for the future use of man, was so disposed as to just suit his necessities. The precious metals would lose their value as such, should they be found in as great abundance as lead, copper or iron; on the contrary the industry of mankind would be almost paralyzed should the yield of the last named metals be materially curtailed; so of coal. These necessities are consequently so placed, and so combined, that their rapid exhaustion or waste is a matter not within the reach of even possibility. If petroleum was found in large quantities near the surface, or if it were all gathered in large reservoirs at moderate depth, it would soon become exhausted, and to a large extent wasted; because the supply cannot, like water so situated, be renewed. Hence, we may rely upon the assurance that Infinite Wisdom has so produced and placed this now indispensible agent to physical progress, that future generations *cannot be despoiled* of that which must be as indispensable to those who come after us, as for ourselves. The researches and observations of scientists, within the past four or five years, have rendered it a matter beyond a doubt that many hundreds of feet in depth of rocks have been completely saturated with oil, and that this class of rocks underlie the greater part of the habitable earth. The oil must be extracted from these rocks at a cost of labor and money which will teach mankind to rightly value it, prevent its waste, and under circumstances which will utterly preclude its complete exhaustion.

The falling off of the yield at certain points at the East is abundantly compensated by fresh discoveries in new localities. Late explorations have proved the existence of oil in great abundance in Kentucky, all along the foot-hills of the Alleghany and Cumberland mountains. In Ohio also new and important discoveries are constantly being made. Two flowing wells have recently been struck at Rome, in that State. A fine well of lubricating oil has been struck about thirty-eight miles from Cleveland, in Lorain county. Wells are being sunk within two miles of the heart of that city. Discoveries are also constantly being made in other Western States.

NO DANGER OF GLUTTING THE MARKET.

Notwithstanding the apparently illimitable extent in which it is found, searchers for oil may rest assured that they cater for a market which cannot be glutted. The world will consume, at a fair price, all the petroleum which can be produced. Europe increased her consumption from 10,000,000 gallons in 1862, to over 20,000,000 in 1864. The exports from January 1st, to July 1st, of the present year were about 14,000,000 gallons, showing a large increase. Europe will buy 50,000,000 in 1866, if it can be furnished at a reasonable rate.

THE PRICE OF OIL.

It is a most encouraging fact that the price of oil at the East, is relatively higher now than it was a year ago. In other words oil has not depreciated relatively with the premium on gold; for while gold stands $1.15 per cent. lower than a year ago, oil has only fallen sixty per cent. Petroleum has not only failed to follow the downward tendency to as great an extent as other commodities; but in spite of the most depressing influences, its relative value, is fully fifty per cent. higher than most other articles of trade, and the market is constantly improving. This firmness in the face of increased supply is maintained by the consciousness that the ever-increasing uses to which it is applied, and the increasing demands for it in new quarters, effectually precludes the possibility of a glutted market at anything like reasonable prices.

Wealth of Great Britain.—The present wealth of the British Isles, is set down at fifty thousand millions ($50,000,000,000) dollars.

MATTOLE PETROLEUM COMPANY.

The Mattole Petroleum Company, located in the Mattole Valley, Humboldt county, of which H. C. Howard, of San Francisco, is President, and George McNeir, Superintendent, is situated immediately between the Parsons & Henderson claim, on Joel's Flat, on the northwest, and the Union Mattole company on the southeast. This company commenced boring on the first of July, and have passed through a hard strata of sand-stone rock to the depth of 135 feet, at which point, meeting with a strata of soft shale and oil, it was deemed judicious to tube the well, and thus avoid the possibility of accident from caving.

Immediately adjoining the ground of the Mattole Petroleum company, the same owners have two other valuable claims, upon which work will soon be commenced, viz: The Howard & Martin, and the Lyon companies—the latter adjoining on its southern boundary the claim of Messrs. Knowles & Brown, who have already in their well a fine show of oil. On the Parson & Henderson claim, on Joel's Flat, a large body of oil is at hand, but those gentlemen have determined to continue sinking until a flowing well shall have been reached.

The various grounds referred to are all situated in immediate and close proximity, one to the other, and comprise the choice oil lands in Mattole district. A fine pump, calculated for 300 feet of depth, manufactured by David Stoddart, of Beale street, for the Mattole Petroleum company, will go up on the next steamer.

It speaks well for the great increase of the northern trade that the steamer Del Norte refused to receive freight as early as ten A. M. of the day of her sailing—thus greatly disappointing some parties who were desirous of getting their machinery through to their claims in the oil district.

Wild Bees.—The woods of California seem destined to be soon filled with large swarms of the honey bee. There is no part of the world where this insect seems to flourish as it does here. We hear of great numbers of "bee trees" being found in almost every part of the State. The woods of Nevada and Klamath counties, appear to be particularly favored in this respect. With regard to the latter the Klamath *News* says that within the past three months, more than twenty "bee trees" have been discovered within a mile of Orleans Bar, some of which yielded a large amount of honey. It is safe to estimate the number of colonies of wild bees in Klamath county by the hundred, all of which have come from two hives imported from Pennsylvania, in 1857, by T. R. Thomson.

The Comanche.—This monitor, which it seems was accepted from the contractors before it was finished, is at present at the dry dock, at Mare Island, having been completed at the cost of the Government. She is now ready for service. During the short time she was afloat her bottom became overgrown with a thick growth of weeds and shells. To prevent this in future she is being coated with a preparation that destroys both animal and vegetable matter.

A Singular Cave.—In one of the numerous limestone hills which are found about ten miles from Austin, Reese River, there exists, according to the *Reveille*, a cave large enough to hold comfortably sixty or seventy persons. During the heat of the day this cave is refreshingly cool. At noon when the temperature is at, say 80 degrees, it is not more than 50 degrees in the cave. The sides of the cave are covered with a kind of natural pitch, which has the peculiarity of being soluble in cold water. It is used by the Indians to fasten their arrow heads.

Uncalled For.—A sale of unclaimed packages, in Adams Express office, recently took place in Washington. The packages numbered about 3,000, and the sale continued several days. They generally brought from $4 to $15; they were mostly worthless, although some valuable prizes were picked up.

THE NEW EXCELSIOR DISTRICT.

Although the floating population in this district is beginning to leave in consequence of indications of an early winter, there is nevertheless much activity manifested among the permanent portion of the miners who have already struck a good prospect.

Winter & Robinson's new mill was started on the 14th instant, upon Excelsior rock. This is the first mill completed in the district; although two others are nearly ready to start. The mill of Mr. Long will be second to start, while the California Company have the machinery and lumber for their mill already on the ground. Two hundred pounds of ore from the White Mountain lead, worked at the Mariposa Mill, Virginia, yielded at the rate of $36 per ton—$30 in gold and $6 in silver. The ore was a fair average from near the surface. With the advantages to be had in the district for water, fuel, etc., ores yielding even $25 per ton will be found very profitable to work in Excelsior district. The Wisconsin company is reported to have struck richer rock than ever before, and the Excelsior company is sacking ore from their claim, which is said to be extraordinary rich.

A very rich streak of ore some ten inches in width has been discovered in the Enterprise ledge, containing much coarse gold and much richer ore than any yet found. One piece of gold found in the rock is worth two dollars. An assay of some rock from this ore shows gold $727.90, silver $15.78. There was no gold visible.

The Virginia ledge, recently located, some two miles west of the Enterprise, is composed of a black looking rock, containing much copper and iron as well as some gold. The sulphurets from many of the ledges in this district, appear to be of a very remarkable character, and are probably very easy to work. A specimen in our possession, handed us by our correspondent and travelling agent, Mr. Lattimore, though showing no sign of decomposition, being perfectly bright, and evidently devoid of a particle of galena, nevertheless yield as readily to the knife as that well known ore of lead. This lack of the usual hardness of this mineral is probably due to a peculiar lamilar form of its chrystalization. The specimen is said to contain both gold and silver, although none is visible to the eye.

How the New York Tribune is Conducted. Horace Greeley has recently written a characteristic letter to a friend in which, after alluding to the report that is started nearly every year that Mr. Greeley is about to retire from the editorial charge of the *Tribune*, etc., he says:

We elect an editor of the *Tribune* annually by a stock vote (one hundred shares, one vote each). Once, many years ago, two votes were cast against me for editor—none before or since. I have never heard that any stockholder desired my withdrawal from the *Tribune*.

I mean to reduce my work on it at the earliest moment, and have so stated to all who have a right to know. I am overwhelmed with labor. I grow old, and want rest and comfort. My idea is to get some one else to take the laboring oar, receive the kicks and cuffs, and let me farm a little, fish some, and write when in the spirit. Such is my dream. I hope to realize at least a part of it during the year 1866; but I may not till some time later. You know how circumstances control everything.

At present I am writing about an average of two columns per day, for the *Tribune*—too much; I mean to write less whenever I can. * *

Horace Greeley.

A Significant Fact.—A fact not pleasant but extremely suggestive, has been elicited by the commencement of the Passover on Ballarat (says an Australian paper). The Rev. Hermann, the late appointed pastor of the Ballarat synagogue, killed no less than twenty-two bullocks and seventeen sheep before he could find one that was *kosher*, within the meaning of the Judicial law. The diseases which renders the animal unfit food under the circumstances are almost entirely confined to the head and lungs.

A steamer has succeeded in passing through the famous Dutch Gap Canal. The Silas O. Pierce, a vessel of forty-three feet beam, performed that feat.

THE STATE FAIR—ITS CLOSE.

Among other things which we desired to notice last week, as on exhibition at Sacramento, we will mention Wheeler & Randall's quartz crusher, which was set in operation adjoining one of their famous Excelsior pans. This crusher is very compact in its appearance, simple in construction, and crushes rock with remarkable rapidity. The upper die is worked by an eccentric at the top, and attains a considerable rubbing motion. This was its first appearance in public, and the proprietors received the 1st premium, $10.

Thos. Hansbrow received three first premiums for his world renowned pumps, viz:—best engine pump, $5; best mining pump, $5; best domestic pump, $3. Dr. W. H. Thomas, of Sacramento, received a special premium on his "Ever-primed, Self-ventilating Syphon Pump." This is a new California invention which we may take occasion to describe more fully at another time. Martin Wilcox, of Sacramento, also received a special premium for a new and novel water lifter, contrived so as to raise water by steam pressure (without the aid of an engine), using two perpendicular pipes, floats, valves, etc.

Mrs. Clara A. Bartlett, of Oakland, received the first premium, $5, for best lady's saddle. The invention consists in a convenient device for adjusting portions of the saddle to suit the form and proportions of the rider, and to afford ease by varying the position of the person, by means of a substantially formed slide, and an extension safety-guard on the right side of the saddle.

R. E. Washburn took a special premium on his new style of sluice boxes. His invention places drawers or saving boxes beneath the sluice, containing quicksilver, in such a position as to receive a strong force from the water in its passage, calculated to drive the gold dust into the presence of the mercury. The boxes are readily removed for cleaning up, which enables the miner to avoid being robbed by the most detestable of all kinds of thefts.

W. Wadsworth's American tiller received honorable mention at the hands of the committee. We believe it to be a California invention of much merit.

The following awards are found among the list of first premiums:—Leonard Low, Sacramento, grain separator, $5; Koenig Bros., S. F., boots and shoes, $3; D. & H. A. Winter, S. F., seed plants, $5; Samuel Hill, S. F., Florence sewing machine, $5; P. Mezzara, S. F., plaster busts; Aitkin & Luce, Sacramento, best marble, $10; marble mantle, $15 cup; marble monument, $20 goblet, and also first premium for statuette; H. L. Hopkins, S. F., amalgamator, $10; H. M. Stowe, S. F., chamber drill, $5; E. W. Walton, Drytown, cider press, $10; V. Squarza, S. F., faucet and indicator, punches, cordials, and filters, four first premiums; B. K. Myers, S. F., (Vulcan Iron Works), turbine water wheel; J. N. Horner, washing machine, $5; Will & Frink, S. F., cutlery; Pioneer Woolen Mills, S. F., woolen blankets, flannel, and cloth, $5, $10, and $10; S. Jelly, Sacramento, Grover & Baker sewing machine work, $5; Dewey & Co., Mining and Scientific Press, printing, $3; I. C. Mayer & Sons, furs, $3; Mrs. S. Y. Cheesley, Sacramento, oil portrait and landscape paintings, $3 and $3.

Among other awards we notice special premiums to Samuel Brannan, S. F., sheep shearing machine; J. J. Dennis, Humboldt, petroleum; H. M. Stowe, expanding drill, for boring oil wells; Thos. Peers, Placerville, 7 cases insects; F. F. Smith, Marysville, miniature steam engine, special notice; Wm. Agate, Sacramento, block of Perry's pavement; J. & C. Schrieber, S. F., patent spring mattress; Casey & Kelley, Sacramento, soda fountain; W. R. Frink, S. F., soda fountain; B. K. Myers, lever jacks; T. Scofield, Sacramento, bread slicer, honorable mention; G. H. Mixer, Sacramento, patent couplings; A. E. White, boot blacking machine; W. T. Garrett, S. F., large bell, home make, Col. Warren, of *California Farmer*, several special premiums for seeds, antiquities, coins, minerals, etc.

The races at the Park, on Saturday, were attended by about 8,000 people; Norfolk won the great race, over Lodi, in 5:27½ and 5:29½, 3 mile heats, nearly beating the best time on record, viz: 5:27¼. The purse was $2,000.

Total receipts of the Society amounted to from $16,000 to $18 000. Financially successful, but deficient in many of the features which should characterize the honor and usefulness of our State Fairs.

PALMER'S ARTIFICIAL LIMBS.

No greater earthly blessing could have been vouchsafed to our mutilated heroes, who have been deprived of their natural limbs by casualities in the late civil war of rebellion, than the artificial legs and arms manufactured under the direction of B. F. Palmer, LL. D., with offices in Philadelphia, New York, Boston, and Chicago, for which Mr. Jarvis Jewett is the authorized agent in this city.

Until the invention of this beautiful and artistically constructed artificial limb, the "peg," as it was called, was the best substitute known; and yet that unwelcome and unsightly appendage has ever been more distasteful to a person of fine susceptibility, than the simple crutch. Half the sting and inconvenience of the loss of a limb, has been removed since the invention of Palmer, which is not only an actual attachment to the person; but to the uninformed observer seems to form a part of one's identity, so natural that the counterfeit is often entirely unobserved. Anticipating a great demand for artificial limbs on the breaking out of the war, a large manufactory was constructed by Mr. Palmer, in Chesnut street, Philadelphia, where they are made under his personal supervision, and from whence they are now being turned out at the rate of over 100 per month. These limbs, for all practical purposes, are almost as serviceable as natural ones. They are constructed on the most perfect scientific principles, with a system of springs and wires so arranged as to imitate most closely the natural action of the muscles and joints of the limbs—both arms and legs. The arrangement of the ankle joint, is claimed as quite superior to anything else ever attempted in this line, giving the wearer the ability to move about with a naturalness and ease of motion, most wonderful to behold. It may even be used with grace in the giddy mazes of the dance, and numbers are walking about by the aid of this invention, in a manner which would scarcely give a stranger reason to suppose they had ever been maimed at all—while in reality they have been deprived of both their natural limbs below the knee!

After a patient and careful comparison of the merits of all competitors, the Surgeon-General of the United States and a Board of medical officers especially convened for that purpose, have expressed a decided preference for the Palmer leg and arm over all others, and these limbs are now being very generally adopted by the maimed heroes of our country. We would call the further attention of the reader to the illustrated advertisement of this useful invention, which will be found upon the last page of our present issue.

Cork Fastening.—Among the new inventions on exhibition at the State Fair, we noticed a cork fastening attachment to soda bottles, the right for which is owned and used by Messrs. Casey & Kelley, of Sacramento. A strip of tin is stamped out by a die and looped around the neck of the bottle, forming a collar, to which another strip, passing over the cork, is jointed. The latter piece is stamped ed so as to form a convenient thumb-piece on top for swinging it off the cork. The whole is easily transferred from one bottle to another. The fastening looks neat, is durable, and is preferred by bar-keepers to the wire arrangement, which spoils corks and is difficult of operation. The first set of machinery for manufacturing these fastenings, cost $2,500. Messrs. Casey & Kelley inform us that they can be sold for $5 per hundred, and we can see no reason why they may not become universally adopted.

FROM ARIZONA.

We learn from the *Colorado Miner*, that a party of nineteen have recently left Prescott, the capital of the Territory, to prospect the unexplored country at the head of the Little Colorado, for placer and quartz mines. They got as far as the head waters of the main Sacramento, when they encountered a hostile Indian force, to which they gave battle, routing the Indians, but having two of their own party wounded. They returned to Prescott with their wounded companions, where they had recruited their force and were about to make another start for the purpose of concluding their explorations.

A small 2-stamp quartz mill has been purchased, designed for crushing rock from the Occidental ledge, in Walker district. The *Flag*, of this city, is informed that a Philadelphia company, under the direction of Messrs. Vicroy & Helm, is putting up a 20-stamp mill on a ledge near Turkey Creek. This mill will give employment to one hundred men in a short time. Its location is about thirty miles from Prescott. Gov. Gordon and Mr. Joseph Tyson, are putting up mills in the same vicinity, which is pronounced one of the richest mineral regions in Arizona—abounding in gold, silver, copper, and iron. All that is needed is a sufficient population, or a proper military force, to keep the Indians in check. Gen. Mason has assured the adventurers that, so far as the military are concerned, that matter shall be fully attended to.

New mines have been discovered in Colorado, and a district embracing them has been named Argentine. This discovery is creating considerable excitement. A new military post has been established at Tonto, which will be known as Fort McDowell.

Mr. McCormick, the Secretary of the Territory, now at the East on business connected with his office, writes to the publishers of the *Miner*, the paper published at Prescott, and the only one in the Territory, that he has purchased a new press and type for that office, and that the same will be forwarded with all convenient dispatch. Under the protection of the large military force, which has now been thrown into Arizona, we may soon look for important mineral developments; for that is undoubtedly one of the richest mining regions on the globe.

A Sun Bath.—An open window, with the direct rays of the sun coming in, will be good for the little one. On a hot summer day, to lay it down near the window, quite nude, and let it lie for some minutes where the rays of the sun may fall on its skin, will give it new life. There is a vital relation between sunshine and a vigorous human being. Seclusion from sunshine is one of the greatest misfortunes of civilized life. The same cause which makes potatoe vines white and sickly when grown in dark cellars, operates to produce the pale, sickly girls that are reared in our parlors. Expose either to the direct rays of the sun, and they begin to show color, health and strength. When in London, some years ago, I visited an establishment which had acquired a wide reputation for the cure of those diseases in which prostration and nervous derangement were prominent symptoms. I soon found the secret of success in the use made of sunshine. The slate roof had been removed and a glass one substituted. The upper story was divided into sixteen small rooms, each provided with lounges, washing apparatus, etc. The patient, on entering each his little apartment, removed all his clothing, and exposed himself to the direct rays of the sun. Lying on the lounge and turning over from time to time, each and every part of his body was thus exposed to the life giving rays of the sun, Several London physicians candidly confessed to me that many cases which seemed only waiting for the shroud were galvanized into life and health by this process.—*Dr. Dio Lewis.*

The La Victoire.—We are pleased to learn that the difficulties which, for some time, have existed between the old Board of Trustees of the La Victoire Copper Mining Company, have been satisfactorily adjusted, and that Mr. L. L. Robinson, is now, by consent of all parties, acknowledged the acting President of the company.

The Virginia Daily Union has come out in a new dress. We are pleased to witness the prosperity of our trans-montane neighbor.

A "Capital" Chance.—There has probably never been a more propitious time for the investment of capital in California Quartz Mining, than the present, and when there is such a favorable disposition on the part of Eastern capitalists to lend a portion of their money to help develop our mines, we regret exceedingly that even the slightest portion of their funds should be wasted or thrown away upon wild cat-locations, which have not the semblance of a lode. There is, seemingly, no end to the list of valuable *bona fide* quartz lodes in this State, which are awaiting capital to develop them into permament paying institutions. Many of them are already prospected by deserving men who have not the means to reap, without assistance, the harvest that is already in sight before them. As a sample of this class of mines, we have, in our mind's view just now, one located one and half miles north of Placerville, in a well-known quartz range, the proprietors of which would willingly part with one half for the sake of having the balance worked. The erection of a 10-stamp mill would be considered sufficient. Miners ask no money in such instances, but are willing to look to the yield of their leads for remuneration for money and labor already spent. The company of which we speak, holds, by location, 1,000 feet of the lode. They have run a cut 75 feet in length, and sunk a shaft 6x8 65 feet deep, which, at the bottom, develops the ledge six feet five inches in width, solid quartz and well defined, with regular slate walls. Seventy-five tons of quartz is already out, with sufficient in sight to run a 10-stamp mill six months. The rock from this lode works an average of $15 per ton gold, is uniform, and the owners invite any reliable party desirous of investing to take out five or ten tons and crush for testing the ore before purchasing. A ranch of three hundred and fifty-five acres of timber land also forms a portion of the company's offer. Although this may be one of the most rare opportunities for the investment of money in our mines, yet there are thousands of similar cases where capital only is wanting to produce a sure and abundant harvest.

Coppersmith.—We had the pleasure, last Wednesday, of calling at the workshop of Mr. James Macken, on Fremont street, between Howard and Folsom. Mr. M. was absent in the country; but a young man engaged in the shop took especial pains to show us how the work was done. The workmen were engaged at the time in fastening a steam-pipe for the Market Street R. R. Co., which had been wrenched from the flange, by which it is fastened to the cylinder. They succeeded in making a neat and perfect piece of work. Mr. M. has been engaged in his present business for fourteen years in San Francisco, and since 1853 at his present place. He does a large amount of work for wagon manufacturers in the Sandwich Islands, and for distillers in the interior of this State and in the city. He also does a large amount of marine and steamboat work. His advertisement will be found in another column.

The Jefferson Gold Mining Company, of Brown's Valley, Yuba county, has declared a dividend of $10 to the share. This is the sixth dividend which has been declared by this company. It is said that the daily yield of the mill connected with this mine is from $700 to $1,000. The highest yield is realized when working rock from the lowest drift. The affairs of the company are now in a highly prosperous condition. The work of the last two or three months, is considered as quite demonstrative of the supposed fact that ne lead is rapidly nearing the Pennsylvania claim.

A man in Springfield (Mass.) recently discovered a little tunnel leading from the bottom of a dry well on his premises, and running in a slant from the perpendicular toward the surface of the ground. Investigation showed that the excavation, which was six inches to a foot in diameter, was made by toads, and in it were found no less than fifty-six of them. Some of the diggers were much emaciated, having been at work on short rations for about a month, the time the well had been dry. The tunnel was quite a long one and the toads had only about a foot more to go to reach daylight.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. TURNER HAMILTON, at the Assembly Building, 105 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1861, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5.

New Volume

—OF THE—

Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).

PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers, 505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

U

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE or FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

PREDICTION VERIFIED.—An Eastern paper says that in 1860 Simon Cameron told Jefferson Davis that if the South seceded he would plant corn in the streets of Charleston, S. C. To keep his promise, Mr. Cameron went to Charleston last spring, planted some corn in a street, and put a soldier to watching and attending to it. The other day he got a package of four ears of corn by Adam's Express as the fruit of his enterprise.

A MODEL miniature locomotive, made of gold and silver, with a ruby for a head light, and costing $4,000, is on exhibition at Taunton, Massachusetts. The wheels are driven by clock work.

MODERN AND ANCIENT.—There are 3,598 boats belonging to the Erie Canal, of which number 1,449 are of greater tonnage than the vessel in which Columbus discovered America.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

ASSAYERS
Desirous to commence an ASSAY OFFICE in the mines may buy, at a very low figure, in a prosperous mining county, a complete set of Assaying Apparatus, Scales, Chemicals, and everything necessary to carry on said business. Apply to Lock Box No. 782, Postoffice, San Francisco, stating name and where an interview may be had. 17v10

OIL WELL BORING.
J. SEVENOAKS,
Contractor
For Well Boring and Erecting all kinds of Machinery connected therewith.

Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1729 San Francisco. 2v11

Professional Cards.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Machinists and Foundries.

H. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.
UNION IRON WORKS!
Corner First and Mission streets,
SAN FRANCISCO.
ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices. 2Iv10 **H. J. BOOTH & CO.**

Miners' Foundry
—AND—
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as
Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.

All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.
HOWLAND, ANGEL & KING.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as
Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and
Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,
Manufacturing Machinery of Every Kind.

Sole Manufacturers of

☞ All Jobs promptly attended to. Prices moderate. ☜
No. 125 First street, opposite Minna, next door to Pacific Foundry. 12tf
[Removed from Oregon street, between Front and Davis.]

About Corns.—The shape of a corn is exactly similar to that of a carpenter's nail, having a crown or head, and a stem pointing downwards, which piercing the true under-skin irritates the nervous fibres in its vicinity. To cut off the head of the corn is only temporary relief—a cure can only be accomplished by cautiously digging out the stem, which may be thus done by steady hand; steep it in hot water and rub it in with a course towel or the finger nail will not remove it; place a small quantity of oil on the corn and let it souk well in. Then with a penknife, or what is still better, a sharp bodkin, work it out of its bed as you would a thorn. Not a drop of blood should be shed during the operation, and its success may be tested by finding pressure unaccompanied by pain. A small piece of diachylon plaster with a cessation of pressure will complete the cure. Should inflammation have been excited—which may be known by the redness prevailing around it, rest and emolient applications, such as linseed poultice, or a fig, will be found beneficial.

"Patent Paper Reel for Telegraph Register."

San Francisco, Sept. 18, 1865.

Eds Mining and Scientific Press—*Sirs*:—Having noticed the above heading in your valuable paper of the 9th inst., I beg leave to inform you that the invention is not Mr. L. W. Worth's, but one already patented by me, while a resident of Cleveland, Ohio. His form of reel is one that I first got up in 1863, and filed a caveat for, and afterwards improved by putting some gearing, or check machinery, so as not to use so much cord. The length of cord that I use now to run all day, would not run his reel one hour. After making my improvement, I applied for a patent, which was granted to me on the 19th of January, 1864. That patent covers all of his, so-called, improvement, as will be seen by my patent (No. 41,312) which claim reads as follows:

"What I claim for my improvement, is the arrangement of the mutually exchangeable reels D and F, in combination with the gears, cord, pulleys, and weight, the several parts being constructed, arranged, and operating as and for the purpose herein set forth."

This patent was obtained for me by Messrs. Brainard & Burridge, of Cleveland, Ohio, Patent Solicitors. And I further state, that all persons wishing to use said Paper Reels, will please to come and make arrangements with me for their use. As for any advantage he has over other reels, it can only be that he has a greater length of cord to to wind up. The one that I built, of his style, before I had mine patented and after I filed a caveat, had all to be exchanged for my new reel. In putting this up it takes only six screws to do the whole business, and takes up so little room that it is quite a convenient and useful instrument.

Address, HENRY McGANN.

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with OALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.
San Francisco, Aug. 22d, 1865. 10v11-3m

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction. Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Any stock upon which said assessment shall remain unpaid on Saturday, the 7th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 27th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.

Office, 305 Montgomery street, San Francisco. se9

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

SUMMER FRUITS.—Acids promote the separation of the bile from the blood, which is then passed from the system, thus preventing fevers, the prevailing diseases of Summer. All fevers are billious—that is, the bile is in the blood. Whatever is antagonistic to fever is cooling. It is a common saying that fruits are "cooling," and also berries of every description; it is because the acidity which they contain aids in purifying the blood. Hence, the great yearnings for greens, and lettuce, and salads in the early Spring, these being eaten with vinegar; hence, also, the taste for something sour, for lemonades, on an attack of fever. But this being the case, it is easy to see that we nullify the good effects of fruits and berries in proportion as we eat them with sugar, or even sweet milk or cream. If we eat them in their natural state, fresh, ripe, perfect, it is almost impossible to eat too many—to eat enough to hurt us, especially if we eat them alone, not taking any liquid with them whatever.

MORE than 300 dead bodies which were found in New York and the harbor last year, were buried without recognition.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

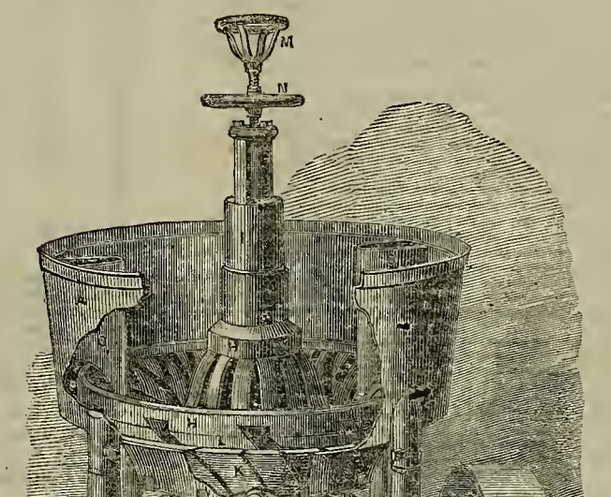
Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.



THE WHEELER & RANDALL Grinder and Amalgamator

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

PEACHES WITHOUT STONES.—We find the following in an Eastern journal: To make peaches grow without stones, an agriculturist who has tried it with success, says: "Turn the top of the tree down, cut off the ends, stick them into the ground, and fasten so with stakes. In a year or two these tops will take root, and when well rooted, cut the branches connecting these reversed and rooted branches with the tree proper, and this reversed peach tree will produce fine peaches without stones." The same experiment may be tried with plums, cherries and currants.

M. GNUVERNEUR, a printer of Nogent-le-Potrou (Eure-et-Loir) has succeeded in making gas for lighting with the refuse of the apples and pears used in making cider and perry. This gas is said to be superior to that made from coal, as it emits neither smoke nor smell. The cost is estimated at 10 centimes (one penny) for the first cubic metre, and 5 centimes for the remainder.

Agent Wanted.

Machinery.

ATTENTION, MINERS!

LINSCOTT'S PATENT CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¾ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

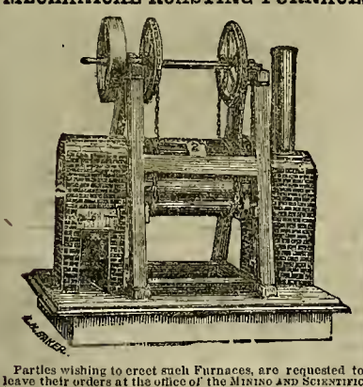
The Mechanics' Institute

AWARDED A

PREMIUM SILVER MEDAL

TO BRUCKNER'S

MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders at the office of the MINING AND SCIENTIFIC PRESS.

W. BRUCKNER, Mining Engineer,

M. DISNEY'S

Endless Chain Water Wheel

Gives the greatest power from the same amount of water of any wheel in use. Every pound of water used gives one pound power. It is cheap and easily constructed, and can be built anywhere, and may be so constructed as to give any amount of power according to the amount of water and the fall. It is now on exhibition at

521 Market street, in this City.

All are invited to call and see for themselves. We are ready to put in Wheels either on sluggish streams or under head. RIGHTS FOR SALE.

☞ This Wheel is peculiarly adapted to running streams, where parties cannot build dams so as to make use of the fall.

M. DISNEY, Inventor.
San Francisco, Sept. 6th, 1865. 11v10-4w

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing simi lar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

Illustrated in the Mining and Scientific Press, April 9th, 864.]

HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,
24v9

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA, WASHOE, ENGLAND, FRANCE,

— AND —

THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,
Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apertures and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

NOTICE.

The undersigned having purchased the EXCLUSIVE RIGHT in and for the State of California, for the

Manufacture and Sale of

WINHAM'S

PATENT HOSE COUPLING,

Hereby caution all parties against the manufacture or purchase of the above Hose Couplings, except through us, as any infringement will be prosecuted to the full extent the law.

SALMON'S

PROPELLOR AMALGAMATOR

— AND —

Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 J. & W. C. SALMON.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

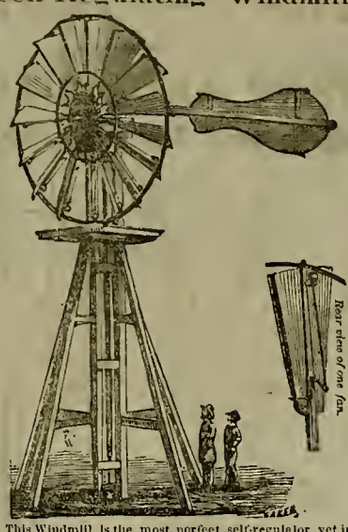
26v10

ATWOOD'S

Self-Regulating Windmill.



This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

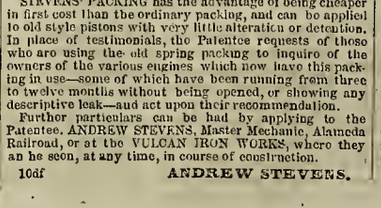
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

16df ANDREW STEVENS.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S

AMERICAN DOUBLE TURBINE,

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30¾. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 400 to 500 pounds, will yield from 30 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,
At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11-tf

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heinch & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

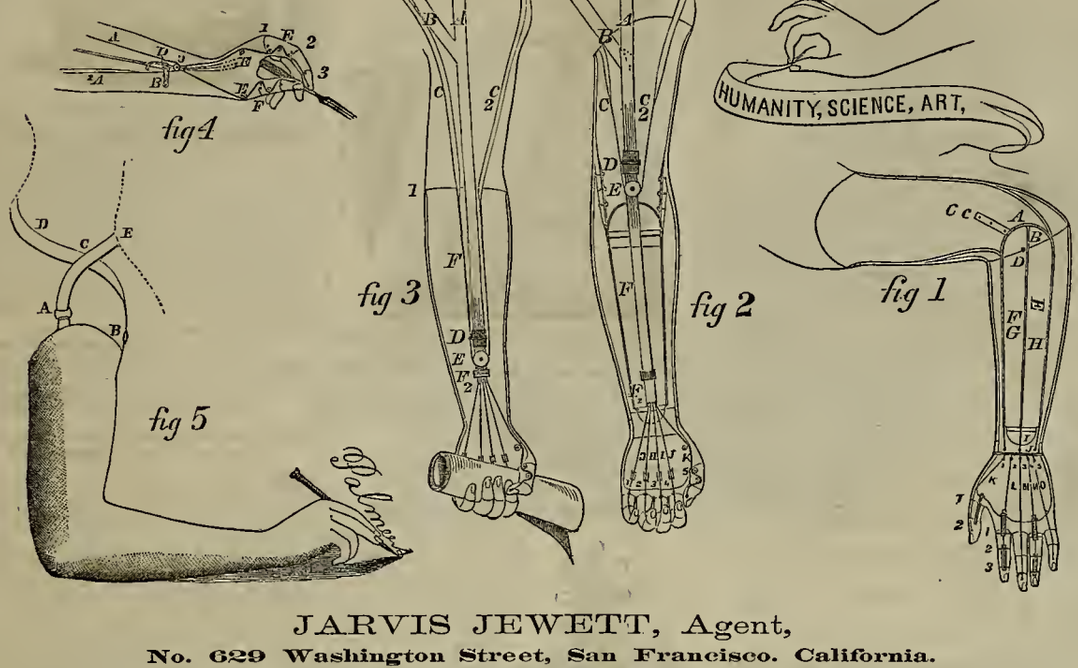
DO NOT BE DECEIVED.

PALMER'S PATENT ARTIFICIAL LEG AND ARM

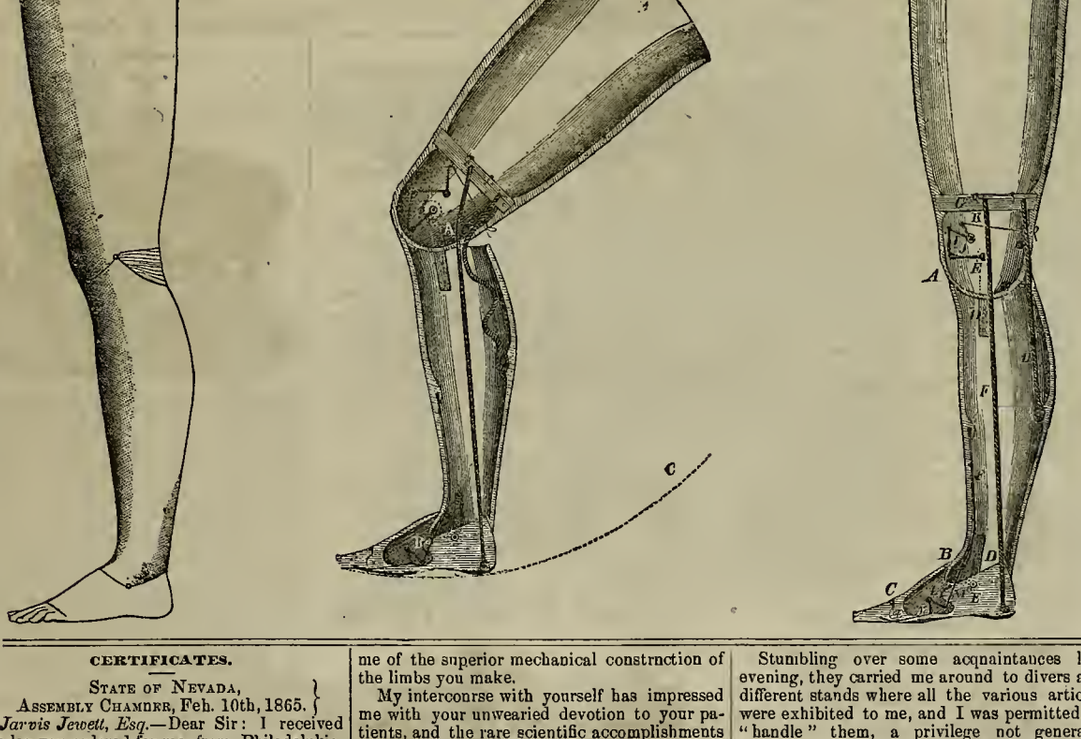
Are Unequalled by any in the World!



JARVIS JEWETT, Agent,

No. 629 Washington Street, San Francisco. California.

AT L. P. FISHER'S OFFICE.



CERTIFICATES.

STATE OF NEVADA,
ASSEMBLY CHAMBER, Feb. 10th, 1865.

Jarvis Jewett, Esq.—Dear Sir: I received the leg you ordered for me from Philadelphia. Thursday, since which time I have been wearing the same with satisfaction and delight. I am satisfied I could not have been better pleased and more exactly fitted, had I visited the factory myself. It is my intention to write a testimonial for Palmer's pamphlet, and as a voice from the Sierras, express the gratitude that I feel I owe him, in which I will make favorable meution of you.

Respectfully,

CHAUNCEY STEWART.

Opinion of a Military Hero—Maj-Gen. Daniel E. Sickles.

BREVOORT HOUSE, New York,
January 12, 1865.

SIR: I have great pleasure in bearing testimony to the excellence of the artificial leg you made for me. Although I have not worn it constantly, for reasons affecting my general health, I have used it long enough to convince me of the superior mechanical construction of the limbs you make.

My interconrse with yourself has impressed me with your unwearied devotion to your patients, and the rare scientific accomplishments you bring to their relief.

In placing this note at your disposal, I only perform a duty to my comrades who may, by the fortune of war, have occasion for your services.

I remain, dear sir, very respectfully,

D. E. SICKLES,
Major-General.

B. FRANK PALMER, LL.D.

FROM THE PRESS.

Jarvis Jewett, of 629 Washington street, exhibits a patent artificial leg, (Palmer's,) which is, for all practical purposes, almost equal to the natural article, and certainly superior thereto in some particulars. The arrangement of the ankle joint is claimed as superior to anything ever before attempted in the line, giving the wearer the ability to move about with a naturalness of motion not attained by any other invention.—*Alta, Sept. 9th.*

Stumbling over some acquaintances last evening, they carried me around to divers and different stands where all the various articles were exhibited to me, and I was permitted to "handle" them, a privilege not generally granted to visitors. I was especially interested in Palmer's patent leg; a better contrivance, it seems to me, to replace a lost limb, cannot be invented. I have often wondered how the things worked, and last evening succeeded in understanding it fully—there is a system of springs and wires which imitate the action of the natnral muscles very closely. Jarvis Jewett is the agent, and to his kindness I am indebted for my present understanding—the very article, by the way, which he furnishes. As I do not stand in need of a leg myself, and Cherrylips could scarcely be persuaded to submit to an amputation of her natural members in order to be provided with artificial ones, I trust that no one will think I am bidding for a leg in this notice.—*San Francisco Correspondent of the Sacramento Union, August 25th.*

About four hundred of these limbs were manufactured in Philadelphia, by Dr. Palmer, during the months of June and July last.

RAISING SUNKEN VESSELS.

Insurance companies and others interested, are often surprised to see vessels containing valuable cargoes go down unaccountably in the still waters of a harbor, and there lie tauntingly in view, but defying all attempts at raising them to the surface. Numerous plans have been devised to meet such emergencies, but generally without success, as in each case

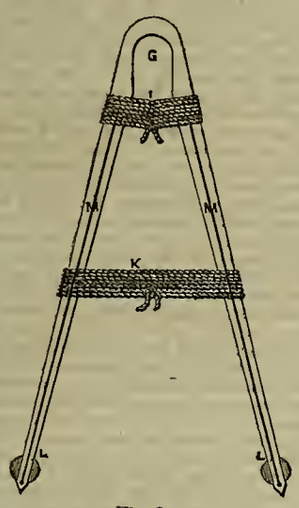

Fig. 3.

the engineer having charge of the job has trusted to circumstances and his own wit to suggest a plan of operations. Inventors are now, however, beginning to take the matter in hand and develop processes by which the engineer is enabled to go to work at once, without the trouble and perplexity of having to invent a new process for every ship to be raised.

We illustrate, to-day, a method for raising sunken ships, invented by Mr. Austin Z. Page, of Weaverville, Trinity county, in this State, and patented by him through the Mining and Scientific Press Patent Agency, on the 6th day of June, 1865.

Near the stem of the sunken vessel is moored a "camel," represented on the right of the engraving in Fig. 1, over the bow of which projects a strong spar, to which is attached the double crutch or fulcrum, represented in the same figure as in position astride of the bows of the sunken vessel, and represented by itself in Fig. 3, to show its construction. Two other hulls or "camels" are also moored near the stern of the sunken vessel, one on each side. On the decks of these "camels" are fixed capstans, by the aid of which a chain is drawn backward and forward under the bows of the sunken vessel, having been lowered and kept in position by means of the crutch already mentioned and guided in its see-saw motion by pulleys or guide wheels fixed at the bottom of the arms of the crutch. This saw-like motion is kept up by alternate action of the capstans on board the two camels represented on the left of Fig. 1, until the chain is firmly introduced under the keel of the sunken ship. Three chains are thus brought into position as shown in Fig. 2, when the two camels are brought up and placed on opposite sides alongside the sunken vessel. A framework made of heavy timbers placed at right angles to each other, is supported by jack-screws or hydrostatic presses on their decks. To this framework are attached the chains which have been introduced under the bottom of the vessel as above described. Power is then applied to the screws or presses supporting the fore and aft chains, which are raised as far as may be conveniently done, when the chain in the center is raised and "hauled taut" to support the sunken vessel, while the timbers fore and aft are lowered, and the chains shortened for a second lift, when the whole process is repeated as often as may be necessary to raise the vessel to the surface.

The principal novel feature of this invention is the method of introducing the chains under the keel of the vessel by means of power applied above the water, together with the lever and crutch for keeping them in position while being introduced. The use of the framework of crossed timbers for the attachment of the chains is also new, while the whole combination serves to give to a hitherto hazardous and uncertain process the regularity and precision of scientific engineering.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

A Visit to Mono Lakes—the Dead Sea of the West.

Messrs. Editors:—Taking occasion, while at Bodie, to see with my own eyes something of what had been represented to me by former visitors, in such a marvelous way as to impress me with the determination of not losing the opportunity of a visit to this "pictured" anomaly of nature, I mounted a goodly mustang and started with the rising sun, on a fine, clear September morning, from the Empire Hotel, Bodie, with a most invigorating and bracing breeze,—such as these heaven-ward altitudes afford. I made the ascent of the Summit, a point of elevation nine thousand feet above the sea-level, from whence a most distinct view may be had of the Lake, seemingly at your feet, while in reality twelve miles distant. Here, indeed, was a position from whence Nature's features in its most rugged and furrowed form could most distinctly be gazed into; for, scan the horizon where you would, the view was bounded by mountain ranges equally as precipitous as those on which you stood, with the Sierra Nevada as father of all, towered its snow-capped peaks and granite battlements in rugged grandeur far beyond them in etherial distance. To the west and south, as you glance from here, stretches this monster landmark of the region of gold and silver, with its "castle-peak" on the west and "Mount Dana" on the south, each respectively, according to Professor Whitney, 13,000 and 13,500 feet high. To the southeast the view is obstructed by the seared front of the White Mountain range, presenting in their calcareous whiteness, one of the most sterile aspects imaginable; not even a sage-brush disturbs the uniformity of outline and coloration of this exuberant out-crop of alkaline earth. To the east and northeast may be seen the Walker River mountains, with their sides sparsely covered with stunted pines; while to the north and northwest, the eye is lost in an eternal succession of foot-hills, rolliug aud undulating in a never-euding variety of altitude, as if doing a submissive homage to their snow-crowned monarch—which stands as if threatening them on their western horder. Yet, amidst all this sterile grandeur, Nature's bounteous hand seems stretched forth, presenting many of those life-giving "Edens," which are here not unfrequently to be found, like oases, in the desert, inviting man to partake of the sustenance they so bountifully afford, and which in these regions would seem to be uo less acceptable than the gold and silver she presents in the hills and mountains which surround them. Many of these can be viewed from here, which, under the never-flagging care of the industrious ranchman, produce abundantly of the necessaries of life for the miners and their stock.

Having spent some time in the contemplation of this vast and instructive panorama of nature, and being much impressed with the littleness of man's puny efforts, in attempting to produce the sublime and the grand, as compared with the astounding productions of naturc, I started once more for the lake. After "drifting" about in search of the most practicable route by which to make the descent, I at last came across an Indian trail, which led me into "Quimby Cañon," thence into "Cottonwood Cañon," and followed the latter in its course dowu and through mountain gorges for a distance of about seven miles, when I found myself on a plateau of land—alkali and sage brush. In crossing this plateau to the waters of the lake, several of those rings or benches are met with, by which the lake is encircled on its northern and eastern sides, graduated in their hight from one hundred feet, being the hight of those farthest off, to five or six feet in those nearer the lake. Their distance apart is graduated in like manner as they approach the water's edge. The water-marks of alkaline deposit, and other sedimentary matter, clearly shows the retrocession of these waters, and even now there is the clearest evidence possible, all around the lake shore, to prove that it is receding at a rapid rate as time rolls on. The present extent of this lake, according to my informant—who, by the way, ought to know, for he was a mariner "bold and brave" on the waters for some two years—is about thirty miles lrom northwest to southeast, by nbout twelve miles across. The first thing that strikes the visitor on approaching it from the point of observation which I took, is its islands, and the steam ascending therefrom; for on one of these islands are a number of boiling springs, which emit a continual flow of intensely hot water and steam, while right on the edge of one of these boiling caldrous is a most plentiful flow of the purest spring water, ice cold. On these islands are innumerable traces of volcanic disturbance. On every side you turn are to be seen extinct craters, with the lava aud other igneous remains lying all around them in regular curvature form, many of them retaining even to this day the identical forms assumed by them when, on being belched forth from Pluto's crucible, they flowed over the margin of the already solidified crater, falling beyond which they formed in cooling some of the most beautiful figures imaginable, while others took on themselves every shape belonging to the crystalline family. A few of these curiosities I have forwarded to the Press. There are to be found, all over these islands, some of the most beautilul calcareous and alkaline incrustations, which form on the surface of everything that the water of either the lake or that emitted from the hot springs happens to come in contact with. These would certainly be a great acquisition to any cabiuet, but from their fragile texture are difficult of transportation.

The waters of this remarkable lake are so strongly impregnated with alkali that to remain therein a few minutes would he sufficient to take the skin off; even to wash the hands therein causes the skin to shrivel up, unless immediately rinsed in fresh water. There are no fishes of any kind whatever in this water, nor are they to be found in the streams that empty into it, even those streams issuing from the Sierras emptying into this lake. These streams, though flowing from a great hight, and for several miles, are entirely barren of fish; while all other mountain streams in this region abound in piscatorial productions. But it will not do to say that life cannot be sustained in this alkaline solution, as I uever have beheld a body of water of any kind so full of animate matter, consisting of myriads upon myriads of aquatic insects and animaculæ, which literally fill the water. You first find them as a larva floating on the surface, where they are no doubt deposited by a peculiar sort of black fly, which is also equally numerous; next they are seen in a more advanced stage of perfection, appearing lower down in the water and on the bottom, in the form of animaculæ. Still more advanced, they appenr moving in the water in the shape of a small grub-worm, swimming around after the fashion of little fishes; but the last and by no means pleasantest form in which we find them, is in little carcasses piled up on the shore, whcre they are driven by storms, washed and blown into mounds nud ridges all around the margin of the lake, to a thickness of from one to three feet high, exhaling nt all times a very unpleasant odor, aud completely covered with these same flies, which seem to be either feeding on the decomposing mass, or depositing their ova. There must be *millions of tons* of the carcasses of these singular insects deposited around the lake shore. When you consider the multiplicity of these, in their different stages of ndvancement, with the flies innumerable that float on the surface, you can form some idea of the condition of the water of this lake—a bottle of which, with the larva, animaculæ, iusect, and fly, I send you. On the surface of this lake are innumerable fowls, chiefly of the wild-duck species; also immeuse flocks of gulls, geese, swan, and brant, visit this "alkaline bath" in the wintcr, remaining till spring, when they deposit their eggs on the islands in the lake, without attending to them more. A most plentilul supply of this article of food is afforded to the few settlers and miners residing in the vicinity of Mono. Many of the ducks and fowl that fall a prey to the sportsman's unerring rifle are found to have the webs of their feet completely eaten off by the corrosive action of the water.

Though there are numerous large streams, and some deserving the name of rivers, flowing into this exhaustive receptacle, besides hundreds of fresh water springs gushing up within it from the bowels of the earth, there cannot be traced a single visible outlet. Another strange peculiarity of the lake is, that in time of greatest floods, such as thunder-storms and melting snow in the Sierra must produce, when it wonld at times—as letter-writers from here describe it—"seem as if the floodgates of the heavens were thrown open," from the immense volumes of water that tumble into the lake from the surrounding mountains, there never has been noticed the least increase in its volume or elevation at its margin. Though seemingly well sheltered with the immense succession of mountain ranges that encircle it, yet rarely indeed can a more boisterous sheet of water be found. Storms and hurricanes prevail here for full nine months of the year; not regular or continuous during this period, by any means, but coming in the most fitful and sudden manner, without, at times, the least admonition to the adventurous navigator, thereby rendering a trip for pleasure anything but pleasant to those who might desire the enjoyment of that luxury over the brackish waters of this twin sister to its oriental namesake.

At the southern extremity of the lake stand the remains of three very remarkable volcanos. Reaching to a hight of some 1,500 feet, are three cone shaped mounds, at the top of which are several vacant craters, presenting cavities of variable depths, some of which cannot be sounded; while others are found to be only fifty to two hundred feet deep, and from thirty to fifty feet in diameter, from which once belched forth immense volumes of molten matter, such as is now strown all around from summit to base of these vast accumulations from nature's internal furnace.

In addition to these, and also those mentioned in speaking of the islands, are numerous others along the margin of the lake, as also far back upon the plateau surrounding it, showing plainly that the entire region encompassing this lake, and over which it extended itself, was once subjected to the most remarkable disturbances from volcanic action. Yet, repulsive as the general aspect of this wondrous and romantic region would seem to be, it appears to possess attractions sufficient to induce man to take up his abode here. The arable lands around Mono Lake are few indeed, yet such as are found are taken up and cultivated to good advantage. There is also a saw-mill here, from which is procured all the lumber required for the surrounding mining camps. An inexhaustible supply of the finest timber can be had all along the western border of the lake, where it washes the slopes and declivities of the Sierra.

As night approached I began to think of winding my way back; when, after once more crossing over these mounds of fetid insect carcasses, and passing through the clouds of sluggish black flies, that reluctantly rise in swarms as you pass, I retraced my steps for purer air, seeking to regain the rugged pathway by which I came. After securing my mustang and having my sacks of relics and specimens snugly strapped behind the saddle, and myself once more astride, I soon found myself pursuing the trail which—perhaps in ages past—had been marked out by "warrior Piutes," little dreaming then that "pale-faces" would one day disturb their quiet haunts, and interrupt their peaceful visits over this same rugged trail to Mono Lake, where they regularly went, from other sections of the country, to procure a supply of this luscious article of food—these same insects I have just been describing. Even to this day, the few Indians remaining around here collect these worms at the lake, dry them in the sun, roll them between stones with a flat surface, when a white kernel rolls out, which they mix with flour of dried roots and wild rye, as an article of food.

Just as the parting sun was about to withdraw his golden rays from the mountain peaks, I attained, after much hard climbing up the devious pathway, the eminence from whence I took the dive at early morning, to peep into nature's wondrous ways, and from whence I now again reviewed the landscape stretched before me, taking a last—at least for the present—wondrous look over the surface of this strange sheet of water; which done, I turned homeward, leaving behind "Lake Mono"—or the Dead Sea of the west—and carrying in my mind one more additional proof of the reflection, that the more we see and study the handiwork of the Omnipotent, the more shall we be impressed with a sense of our own inferiority and entire dependence.

J. R. M.

If one should give me a dish of sand, and tell me there were particles of iron in it, I might look for them with my eyes, and search for them with my clumsy fingers, and be unable to detect them; but let me take a magnet and sweep through it, and how would it draw to itself the most invisible particles by the mere power of attraction. The unthankful heart, like my finger in the sand, discovers no mercies; but let the thankful heart sweep through the day, as the magnet finds the iron, so it will find in every hour some heavenly blessings; only the iron in God's sand is gold. *O. W. Holmes.*

Wood for the San Francisco Market. It is estimated that within six miles of either side of the Mokelumne, there is not less than 1,000,000 cords of wood now standing which must find its market in San Francisco, leaving an equal or greater amount for home consumption. Bordering and accessible to the Mokelumne there are three hundred square miles of wood lands, containing, by careful estimate, not less than 5,000,000 cords.

[Written for the Mining and Scientific Press.]

Summit City—Excelsior Mines.

Messrs. Editors:—Since I last wrote you from this place, I have taken a general tour through this newly discovered district, for the purpose of examining what has caused so great an exodus hither. As you might suppose from my last, my first visit was to the "Enterprise," the rock of which has already been tested by mill process; and at the depth of twenty feet the average yield has been upwards of $160 per ton, and that in a Virginia City mill, which certainly is not so well adapted to crushing and separating gold rock as those of Grass Valley. There are seven men at work blasting and sinking a shaft on the Enterprise, and the rock looks rich. At the depth of twenty-five feet the lode seems to be about five feet wide, the general course being nearly east and west. I next visited, successively, the Mammoth, George Washington, Crescent, Wisconsin, Alabama, and many others, on each of which I found parties at work sinking shafts. Free gold, perceptible to the naked eye, is seen in nearly every claim I examined. The Wisconsin and Alabama particularly attracted my attention; from the former they have been crushing rock in a common mortar, making from $10 to $20 per day to the hand. At many other claims you will find them at work and I am satisfied, from experiment, that from $5 to $10 per day can be very generally obtained by the simple hand mortar process—I will send you specimens from different ledges by which you can judge the quality of the rock. Within the last few days a new excitement has sprung up here by the discovery of an immense lode which seems to throw all others in the shade. This was made by P. Taylor, Esq., a well known scientific gentlemen of Virginia City, who has been in the employment of the Gould & Curry Co., and who appears to be well acquainted with the geological formation of our mines. I will give you his own views of this discovery.

"This ledge, named the White Mountain, crosses the hill south of the Enterprise claim, dividing the granite formation which forms the foot wall, and the shale formation which forms the hanging wall. The vein runs nearly a due north and south course, and has been traced by me for about five miles. It is at least fifty feet wide, throwing off innumerable spurs, and seems to be the most prominent vein of the country; all the others having a direct bearing towards it." The first claim taken up on this lode by Mr. Taylor he has named the White Mountain and Madison Company; it contains 1,000 feet and is owned by Mr. Chas. L. Strong, Superintendent of the Gould & Curry Co., Mr. S. H. Mathers, Taylor, and others. There are also the Rothchild, Yosemite Company, containing 1,500 feet, and the "Norfolk," Lodi Company, containing 1,300 feet, owned by Mr. B. Fenton & Co. Every foot of this ledge, so far as I have observed, seems to be claimed. A scientific assay has been made of the rock, which has shown $264 to the ton, at the depth of about eight feet. Work has been commenced on almost every portion of it vigorously. I would also mention the Kentucky ledge, located on the south side of Old Man Mountain, containing 1,400 feet, and having a lode of fourteen feet in width. Specimens I examined show considerable free gold. Also the New York Ledge, New York Company, and extension Cræsus Company, both owned by Messrs. F. B. Goddard and B. Fenton, of New York city, who are operating extensively in this district as a New York company. There are numerous others I would mention, but want of space prevents in a letter which I fear is already too long.

When it is known that you can leave San Francisco and reach these mines in one day, by the Dutch Flat route, and that in less than a year the Central Pacific Railroad will be at their very door, over which the trip can be made in half that time, giving every facility of making transportatiou a trifle, with abundance of wood and water, to say nothing of the beauty and salubrity of this climate, it would seem to me that if our San Francisco capitalists would turn their eyes nearer home than Idaho or other points where the *furore* of steamsh p companies points, and where "distance lends enchantment to the view," this newly-discovered El Dorado would be sought, and good investments made. These valuable mines will soon pass into the hands of Eastern capitalists, if our own moneyed men do not look after it quickly. L.

Summit City, Aug. 30, 1865.

A Massachusetts man has invented a machine that will make 40,000 bricks per day.

MARKLEVILLE CORRESPONDENCE.

Messrs. Editors:—Our mining interests seem to be looking up a little, and we can begin to see our prospects in the future. The Pioneer quartz mill at this place, which has been lying still for several months, has again started up, and is now busily engaged in crushing and working rock from the I. X. L., at Silver Mountain. The rock from this claim not only looks well, but is rich in gold and silver, and pays exceedingly well. The last run by the mill at Silver Mountain, before it broke down, worked about $80 per ton, and the tailings from the same run yielded more than twice that amount. The I. X. L. is a good claim, and no mistake. At the point from which this rock was taken it is only about forty feet deep.

The Buckeye, No. 1, near the I. X. L., (and by many thought to be the same ledge,) have reached their ledge, and found excellent rock, only about fifteen feet below the surface. The ledge was struck only a few days ago, and up to the last news from there they had not get through the ledge. It is thought that rock from this claim will pay at the present depth.

The Lady Franklin Company are sinking a shaft 4½ by 9 feet on their ledge, and are also taking out pay rock. This claim is the farthest up the cañon, and as yet there is no road to their claim. The company are expecting to erect machinery on the claim before going much deeper.

The Buckeye, No. 2, have also commenced work upon their claim. This is on the Lady Franklin Ledge, and the company expect to reach pay rock before winter.

The Morning Star Company are now preparing to ship their rock to Swansea, England. It will cost about $35 per ton to deliver it in San Francisco, where they will receive an advance of $75 per ton, and then wait for the returns from England for the balance. So by this means, if they should get no more, they are getting about $40 per ton for their ore at the mine, which is not bad to take.

Several other mining companies are pushing ahead with their works, and before another year rolls around, we are going to have better times. I verily believe that this region is destined to eclipse the best mining regions of Nevada.

The lumbering business has grown to be of great importance in this section of the country. It is estimated that fourteen millions of feet of lumber, including timbers and fire-wood, have been run down the Carson this year. It is certainly shameful to cut and carry off to other markets the timber from our own mines, for the time will come when we shall want every stick of timber within the reach of our mines for our own use. A drive of about 1,000 cords of fire-wood, besides some 150,000 feet of sawed timbers, destined for Empire City, is now being run out of the Middle Fork of the Carson, which passes through this city. The citizens of the town have been out in crowds to-day to see the drive; and I can assure you that it is a sight worth seeing. To see several hundred cords of wood, of all sizes and shapes, all jammed and crammed, and tumbled in together, as thick as it can float, and traveling at the rate of about ten miles an hour, bumping over the huge boulders in the river bed, forming jams and damming up the stream; then breaking loose, and running like a horde of wild buffaloes, or like a school of snorting porpoises, while the stream is raging from the dams just let off, is no ordinary sight. The river is getting very low to make the driving good; but to help the business, large dams are built, with flood-gates, and while the dams are collecting the water, the drivers are engaged at breaking jams, and getting everything ready for the flood, and when the gates are hoisted, and the water reaches the drive, the folks like to see the wood "git."

Respectfully yours,

Sirrom.

Markleville, August 5, 1865.

Snowy House Fronts.—It is for the love of show, and not for the love of beauty, that so much of our town architecture is bedizened with profuse and tasteless ornament. It is put there for the sake of respectability—an advertisement, perhaps; for any reason except that it is really loved and appreciated. It is put outside, not inside. The owner of the house takes no delight in seeing it. He only sets it up as a sign to the world of his own wealth and importance; very often he puts it all up front, none at the sides or back; for his opulence may be only sham opulence, and he wants to produce the greatest possible effect with the smallest expenditure.—*Building News.*

Mechanical.

STOWE'S PATENT CHAMBER DRILL.

We give, in an advertisement, which may be found in another column, a representation of Stowe's Patent Chamber Drill, for blasting purposes, designed for use in shafts, tunnels, etc. By the use of this drill a chamber is readily excavated, directly in the bottom of the hole, by means of which a lifting force is given to the explosion, so as to produce from four to six times as much effect as can be obtained from a charge deposited in the ordinary straight hole. By an examination of the annexed representation, it will be perceived that the force of the cutters is direct and downwards, similar to a direct acting drill. The only wear upon this drill is upon the cutters, which are so constructed and adjusted as to stand almost as much force as a regular drill, and when worn out, they can be replaced for $2.50 a set. A 1⅜ inch hole may be chambered out to 3½ inches in diameter, in less time than two inches can be driven down in a regular drill hole 1⅜ inches in diameter; while the chamber of a 1⅜ inch hole gives a much greater blasting force than a straight hole drilled the entire distance 3½ inches in diameter. By the use of the chamber, six times the blasting surface is given to a straight hole, in addition to its lifting force. This drill can be worked with a hammer, like an ordinary drill, or by hand, as a churn drill. One set of cutters will chamber out from 50 to 100 holes, according to the hardness of the rock. In sinking shafts and tunnels by the use of this drill, it is estimated that the cost of the labor and powder will be reduced to about one quarter the expense of the same work done without chambering. The late State Fair in Sacramento awarded to this drill the first premium, for the following reasons, as stated by the Committee: "1st, for the simplicity of construction; 2d, for durability; and 3d, for strength of drill.

The importance of some improvement of this kind, for reducing the expense of sinking shafts and tunnels, is well worthy the especial attention of the mining public, and we would particularly call the attention of miners to the advantages claimed to be derivable in the use of this drill.

Mr. Stowe is also the inventor of an expanding drill, especially designed for use in sinking artesian and oil wells, and for which he received from the State Fair a special premium. By the use of this drill, a perfectly straight bore can be made from one quarter to two inches longer than the inside of the tubing which may be used. It can be attached to any common drill at an expense of from $25 to $50. The many advantages which may be derived from the use of such an instrument, in boring oil wells, must be apparent to all acquainted with such work.

New Machinery for Placer Diggings.—The Folsom *Telegraph*, in a late number, speaks as follows of a new process for extracting gold from placer diggings:

Mr. Hodge, the gentleman who some time since discovered that the drift sand on the American river and the red dirt of the hills of this vicinity would pay well for working, has arrived with his patent amalgamator, which will be placed in position at Quigley's steam works, for the purpose of testing its adaptability to work the gold-bearing dirt in this vicinity. The gentleman has no doubt of the entire success of his invention creating a revolution in mining operations in this neighborhood; not long since he tried a ton of red dirt at San Francisco, with his amalgamator, and realized from it the sum of sixty dollars. There are millions of tons of the same dirt in this vicinity. The profit and feasibility of the gentleman's invention, however, will shortly be determined. The machinery will be in position, and in running order in about ten days, as we are informed, when we shall endeavor to give a description of this new system of mining.

In the last number of the *Telegraph* we notice that the machinery is now in full operation. We should be pleased to receive a description of this new machinery and learn how it succeeds.

Another California Invented Breech Loading Cannon.

In the Mining and Scientific Press of June 3d, we gave quite a full description of a breech loading cannon which had been recently invented by Mr. Langshore, of Mokelumne Hill, and which was pronounced by competent judges quite an effective and formidable weapon. We have now to record still another invention in the same line made by Mr. T. J. Crannier, of Vallecito. A correspondent of the San Andreas *Register* has witnessed the operation of this new instrument of war, of which he speaks as follows:

We had the pleasure of witnessing the shooting abilities of this most extraordinary gun, and are convinced that it will discharge, with all the force and accuracy of good rifles, the incredible number of six hundred balls per minute. The entire machinery is encased with a sheet-iron box. The charges are conveyed to the cylinder by means of ingenious machinery placed above the cylinder. The cylinder is six-and-a-half inches long, and nine inches in diameter, containing eighty-four chambers. On the right hand end of the cylinder there is placed a rim with notches thereon similar to those in the cylinder of Colt's pistols. On the same end of the cylinder there are twenty-eight tubes. Each tube discharges one volley of these charges, simultaneously. The cylinder rests in a horizontal position, having a shaft passing through the center, which shaft rests on bearings on each end. Behind the cylinder is placed the machinery for revolving, loading, capping and firing it, all of which works with the same ease and perfection as Colt's revolver, with the additional improvement of loading and capping. The barrels, three in number, are placed in a horizontal position in front of the cylinder, fitting the same accurately and receiving the charges from the chambers in the cylinders in the same manner as the barrel of Colt's pistols. The entire machinery and construction is so accurately arranged that any one who can turn a grind-stone can manage the gun. The correspondent says it is the inventor's intention to give a public exhibition of the power possessed by the model, in a short time, either at Murphys or Vallecito.

How to make Good Iron.—The importance of employing a flux thoroughly suited to the iron ore under treatment has been carefully pointed out by Professor Fleury, of New York, who remarks that the flux serves a threefold purpose. Firstly, it facilitates the elimination of the iron by forming easily fusible compounds with the silica and alumina in the ore; secondly, it protects the iron from being oxidised again while passing the blast down the hearth; and, thirdly, it serves to deprive the iron of most of its impurities, such as silicon, phosphorous, sulphur, arsenic, &c. The quantity and quality of the flux should be adapted to the kind of ore used. Burnt lime gives a great saving of fuel and an excellent quality of iron with some ores, while with others common limestone and shale, free from quartz veins, give equally good results. The advantage of an occasional chemical analysis of the ores and fluxes used cannot be too much recommended to the ironmaster's attention. Professor Fleury has seen instances, and he is not, probably, the only observer of them, where ironmasters were entirely ignorant of the nature of the flux they used. He saw furnaces worked with the most refractory magnesian limestone that could be found, using at least one-third too much, and, of course, delivering a most excellent quality of *red and cold short pig-iron*. To his question as to the reason of their inferior quality of iron, they answered by accusing the ore; a bad boy, they said, will never make a good man. They little dreamed that by using a better flux, and in much smaller quantity, their iron could be made of good quality and at much less cost.

Gold-Saving Machine in Colorado.—The Black Hawk *Journal* thus mentions a new apparatus for saving gold:

We hear of a new-fangled arastra on Mill Creek. Working on surface quartz, it gets $300 per cord where a stamp-mill only gets $80. Half a ton of stuff is put in at night and the same in the morning, and running by water—that is all the attention it requires. It is built in an octagonal form, and in each angle beyond the circuit made by the mullers is a quicksilver riffle, where the gold is caught. In every view of the case, this ought to be termed a neat little arrangement. No quicksilver is lost or wasted, it does not cut nor flour, not coming in contact with the grinding surfaces at all. We should like to see Clear Creek lined with such machines, and there is no reason why it should not be. Their construction and use are cheap, and they do the work handsomely. Mr. Blackburn, the man who is running the one of which we speak, and who is an experienced mill-man and engineer, says that he has been equally successful in treating ore as quartz. He has been running steadily for almost six weeks.

Preventing Oxidation of Iron and Steel.

According to the patent of Mr. J. B. Chambeyron, of Paris, it is proposed to prevent the oxidation of iron and steel by the forced incorporation of volatile metals having little affinity for oxygen. Tinning, zincing, and leading only give incomplete results, and Mr. Chambeyron has discovered that it is only by incorporating into the iron itself, and to a certain depth, a metal or an alloy little affected by the action of oxygen, and considered practically inoxidisable, that iron and steel can be protected from oxidation in sea and other acidulated waters. The means he employs are to introduce zinc alone in the state of vapour into the iron or steel when they are only to be exposed to the contact of oxygen, and to a volatile alloy or compound composed of tin, lead, and zinc in suitable proportions. The proportions are about one fifth of lead, one-fifth of tin, one-fifth of zinc, but they may vary when the iron is to remain in corrosive waters. A high temperature being necessary to vaporise the metals to be incorporated. The operation is performed in cementing chambers. To each of the cast-iron heads of the upper retorts is adapted a tube, the lower extremity of which is immersed in the retort, and the upper extremity is terminated by a funnel, which has underneath a spheroidal reservoir, furnished above and underneath with a tap for shutting off communication either with the retorts or with the interior of the reservoir. The metals to be incorporated are poured in a state of fusion into this funnel, whence they fall into the retort, the high temperature of which converts them very quickly into vapour. In case the pressure obtained by the vapour is not strong enough to produce the incorporation, he causes a part of the gas to flow from the gasometer, where it is held in reserve, into the retorts. When the metallic vapours have been incorporated in the pores of the iron and steel they will be condensed there by a lowering of the temperature, which is preceded by the introduction of a certain quantity of borax, which by its volatilisation in the apparatus will fix the incorporated metals. The retorts will then be opened, after having ascertained by means of a pyrometer that the temperature has fallen below that at which the volatilisation of the most volatile metal takes place.

Chain Factory.—The Machias *Union* says that Boston capitalists contemplate establishing a factory for the manufacture of vessels' chains, wire and wire rigging, in one of the Eastern towns of Maine; and efforts are being made to have a part of the stock taken there and secure the location of the factory at Machias. The capital of the proposed company will be $300,000, and the works will occupy several large buildings, besides a considerable area for wharves, yards, etc. Steam power is to be used, and from 100 to 200 workmen will be employed. It is stated that there is at present no establishment in this country where wire rigging is manufactured. We derive our supply chiefly from England.

The Growth of Courage on the Battle Field.—A reasoning man, with a love of adventure, at first feels alarmed; and his impulse is to run away; and if he has no motive to stand he probably does run. But at each additional exposure he grows less timid, and after hearing canister and grape about his ears a dozen times, begins to think he is not destined to be hurt. He still feels rather uneasy, perhaps; but the danger acquires a sort of fascination; and though he does not wish to be hit he likes to have narrow escapes, and so voluntarily places himself in a position where he can incur more risk. After a little he begins to reason the matter, and reflect on the doctrine of probabilities, and how much powder and lead is necessarily wasted before any man is killed or wounded. Why should he be, he thinks, so much more unlucky than many other people.

So reasoning, he soon can bear the whizzing of bullets with a tolerable degree of equanimity, though he involuntarily dodges or tries to dodge, the cannon balls and shell that goes howling about his immediate neighborhood. In the afternoon he is quite a different creature from what he was in the morning, and unwittingly smiles to see a man betray the same trepidation which he himself exhibited only a few hours before. The more he is exposed to fire, the better he can bear it, and the timid being of to-day becomes the hero of to-morrow; and he who runs from danger on his first battle-field, may run into it on the next, and court the hazard once so dreaded. Thus courage, as it is styled, is little more, with most men, than custom; and they soon learn to despise what is threatened without causing them harm.

Iron Ore in Reese River.—Many of the mining districts in Reese River, abound in iron ore of very superior quality. In the Mammoth district—which, like most of the other districts, has been only partially prospected—large beds or ledges of this ore have been found.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, September 30.

48 shs Ophir at 330 per foot.
12 shs Ophir at 340 per share, b 30.
26 shs Potosi at 480@470 per foot.
2 shs Potosi at 470 per foot, s 5.

Amount of sales.....$120,000 00

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 7th, 1865.

There is no new feature in the condition of the money market. Capital seeking investment and for loan purposes is very plentiful, and rates of interest are easy to the borrower. Bank accommodations rule for the most part at 1 ℔ cent. ℔ month, but we are apprised of certain negotiations of an exceptional character, based upon prime collateral, at 10 ℔ cent. ℔ annum. The demaud for money contiuues moderate in mercantile circles.

The receipts of treasure for the interior are scarcely up to the nsual average, and amounted to less than $900,000 since Saturday last. The bullion product of California last month exceeded $1,900,000, and that of Nevada amounted to $1,100,000 during the same period.

Since the sailing of the last steamer there has been no especial inquiry for bullion, and gold bars are dull at about 840. Silver ranges at par @ ½ ℔ cent. premium for round lots.

Legal Tender Notes contiuue inactive at the Board, hut considerable transactions have taken place on the street at 73@73½c, closing at 73c bid. Our latest telegraphic advices from the East, quote gold steady at 146.

The Share Market has exhibited a fair degree of activity this week, without any improvement in prices, however. Some leading holders of different stocks are selling freely, under the expectation of lower prices, and a nnmber of loans upon this description of secnrity have been called in the past day or two. Nevada advices as to the character of recent developments in a certaiu claim are somewbat conflicting, but we think we are warranted in saying that the future of the Comstock lode is probably more promising at this juncture, than it has been for a month past. The work of exploration will now he renewed with considerable vigor at greater depths in a number of mines, and it is reasonable to presume that something will be found of an encouraging nature.

Alpha is in rather less favor, and small sales were made at $2,100 closing at $2,050 asked. There is no material change to note in the condition of this mine, and the yield of bullion for the month of September, amounted to some $88,000.

Yellow Jacket was dealt in to the extent of 85 feet, receding from $1,350 to $1,300, and selling yesterday at $1,225@1,230. During the week ending September 25th, 1,316 tons were extracted from the mine, and 975 tons were reduced, yielding $34,824, or an average of $35.72 per ton. For the week ending the 2d inst., the yield of bullion exceeded $70,000, making an aggregate of some $250,000 for the last current month. The winze sunk upon the west stratum of this mine, from the 360-feet level, continues in fine ore.

Gould & Curry is much weaker, and 23 feet were sold at $1,300 and $1,155, closing at $1,165 asked. The entire receipts of hullion from this mine during the month of September, amounted to $165,319. Nothing new has beeu developed in the 200-feet level, (below the lower tunnel) and explorations at that point progress slowly, owing to the character of the rock and the qnantity of water met with. From the croppings it is thought that some good pay ore can be taken, and arrangements are being made to develop this portion of the claim.

Savage is in less request, and trifling sales were made at $1,150@1,100. It is proposed to start a drift running west from the shaft in the fifth level; meanwhile about 150 tons of ore will he taken daily from other portions of the miue. Receipts of bullion last month amounted to $96,500.

Crown Point was sold at $1,225@1,200—assessment of $100 per foot delinquent—and closed at $1,165. We can learn of nothing new in this claim. Belcher was dealt in at $860@840, closing at $830. The two drifts from the shaft in the fourth and fifth levels have met with nothing of much promise as yet.

Hale & Norcross has ohtained less favor, and some 350 feet changed hands, declining from $750 to $585, rallying to $800, receding to $610, then selling at $677½, assessment delinquent, and closing yesterday at $675. The south winze from the 535 feet level has attained a depth of some 100 feet, and until communication can he had with the south and west drifts from the incline at a depth of 700 feet, nothing very definite can he ascertained as to the real value of recent developments.

Ophir rose from $330 to $525—assessment of $100 delinquent—and was sold yesterday at $510@512. Preparations are being made to renew explorations in this mine, from the hottom of the Mexican shaft. The details of the recent settlement with the Burning Moscow Company have not yet been made publlc.

Chollar has been tolerahly well maintained within a range of $512 @460, and 165 feet were sold in all, closing at $465. Potosi was deal in to the extent of 200 feet, receding from $492 to $470, and selling yesterday at $450. An assessment of $19 per foot was levied on the 3d inst. The product of the Chollar-Potosi mine now averages about 100 tons of ore per day. The new shaft is down some 400 feet.

Imperial has heen comparatively steady, and some 1,000 shares were dealt in, receding from $230 to $220, advancing to $232½, and selling yesterday at $229@226. The receipts of hullion during the past month amounted to $88,018.03, and $30,875.66 were carried over from August 1st, making an aggregate of $119,693.69. The ordinary expenses for August were $39,622.09, and $18,591.84 were expeuded for winter supplies, etc., in all $58,212.93; leaving, on the 1st inst., a surplus in the treasury of the Company of $61,480. Out of this sum a dividend of $10 per share ($40,000) will he disbursed on the 10th inst. and $21,480 will remain at the credit of tho Company. A large portion of the supplies required for the ensning six months have been bought, and the entire liabilities of the Company amount to $14,315, maturing from October 23d to Novemher 15th. The Rock Point mill has lately undergone extensive repairs, and its reduction capacity increased to 70 tons per day. During the present month at least 2,800 tons of oro will he crushed by the Company's two mills (some 400 tons more than last month), and a considerable portion of this ore has already been taken from the mine.

Empire Mill and Mining Company rose from $221 to $237½, and closed at $235. Bullion advanced from $125 to $160, fell to $125, and sold yesterday at $127. Exchequer was sold at $26@28, closing at $26. Daney was sold at $36@31; Sierra Nevada at $18½@22½; Wide West, $8@6, closing at $6, and Justis at $16@17½.

The aggregate recorded salos of Stocks, since Saturday last inclusive, amounted in the aggregate to $917,443.

To Blacksmiths.

An excellent, strong lad, from the interior, 17 years of age, desires to learn the Blacksmith's trade. His parents wish him to engage with a reputable firm, and learn his business thoroughly. Address, or inquire at the office of the MINING AND SCIENTIFIC PRESS. 12v1ltf

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our forme location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

MINING AND SCIENTIFIC PRESS PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed with its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared, time fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will obtain that it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application be rejected we a cause through investigation to be made him the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications filed in the office, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delays on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
n appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

Mining Summary.

CALIFORNIA.

SHASTA.—The *Courier* snys tbat under the auspices of Mr. L. A. Kelly, a company has been incorporated under the name of the "Union Gold and Silver Mining Compaay," with twenty-two hundred shares, at $100 each, which hns purchased the "Jones ledge," at Lower Springs, for $136 per foot, aud will at once proceed to erect a steam mill on n convenient site, for tbe purpose of working it. L. A. Kelly is superintendent. The working capacity of the mill will be about ten tons per day, aad of tbe kiad known as "Little Devil."

Mr. Conger will erect his prospecting mill either at Lower Springs or Middletown. It will be in operation this fall. Good lodes await his iavestigation at hoth poiats.

PLUMAS.—We learn from the Quincy *Union* that the Cosmopolitan Copper Mining Company have sold out their claim at Genesee Valley, for the sum of $150,000. The purchasers are Mr. N. P. Sheldon and Hoa. Chas. W. Tozer, of Virginia City, Nevada. The amount of ground sold is five thousand four hundred feet on the celebrated Cosmopolitan veia, wbicb is considered one of tbe most valuable copper mines in the State. Tbis is said to be the largest sale of property ever effected in Plumas county.

SIERRA.—The *Mountain Messenger* (Downieville) speaks highly of tbe mines of Sierra, Long, and Dog Valleys. Describiag a visit to St. Mary's District, the editor says: "We lately visited this new mining locality, aad found speculation rife among the burghers of tbis vicinity. One cabin, intended for a wbisky trade and pioaeer blacksmith shop, was in process of erection. Wc met several gentlemen from Washoe and other parts, and upon visiting the ledges eaw a liberal amount of paper stuck along their course, timber ranches taken up, and more or less light prospecting done. What etruck us most favorably, was the big names put on some of the notices, after seeing which, we concluded uot to invest for the presont. The names of ex-Gov. Weller, ex-Gov. "Bigler," ex-Gov. Downey, ex-Judge—hut we cauuot romember tbem all—looked ominous of law suits, freeze-out and gobble-up.

A correspoadent of the *Messenger*, from Alleghany, says that matters in that regiou are rather looking up. Mr. Newell bas a small mill ia operatiou whicb grinds the quartz instead of crushing with stamps. He claims the ability to crush eight tons per day, tbe quartz heing firet burnt in a kiln.

Mr. Barton, of Sacrameato, will have his quartz mill ready for crushing by tbe first of Octobsr, on the Twenty-One ledge. The compaay has already quartz enough out to keep tho mill ruuning all winter. The ledge far exceeds tbe expectations of all, as it coutinually grows wider, being now six feet wide, and tbe quartz much richer than at first. The Union is reported to bave struck anotber pocket; but little ie said about it. I think it is only a very small oae. The Fac Simile are working in the upper tunnel, as there is no water to coatend witb, and the lower one is of such solid rock tbat they have been able to peaetrate but thirty feet during the last year. The Oak Flat Company are etill bard at work, nnd those who have the management of it are levying heavy useessments, and are buying up nll tbe stock. Tbe Winnieford and Ditto ledges are etill considered rich. The winter will be more lively tban tbe summer hae been, aud no one need be idle.

NEVADA.—Extensive prospecting, says the Grass Valley *National*, is now going on in what is known as the Live Oak district, about five miles this side of Illinoistown. The gold is very fiae—best described by the term "flour gold." The rock is so much decomposed that its surroundings are worked in a rocker, and even then it produces from eight to twelve dollars per day. The priucipal ledge is called the "North Americaa," and is from five to six feet in width Claims have been taken up for miles around, and great enthusiasm prevails.

The *Union*, in speakiag of the mine owned by McFadden, Thomas & Co., which lies about a mile and one quarter from Grass Valley, says that the company have been steadily at work for tbo past two yenrs, aad have run a tunnel along the ledge for a distnnce of about three hundred feet, striking a fine ledge well defined throughout, gold being seen ia all the rock as they progress along the ledge. The Ophir Hill Company, whicb is the adjoining claim, hnve already struck rock which pays $150 per ton. From present indications in the Rich Hill mine, wo think tbe owners bave struck tbeir pile.

Tbe Nevada *Gazette* learns that Messrs. Gray & Jenkins, the owners of the old Illiaois Company's quartz ledge, have negotiated for the sale of the same, the price having been agreed on, and the transfer will be made in a few days. This is one of the oldest quartz locations in tbe county, the claim having beea taken up in 1851, nnd the Revere mill was erected that season for the purpose of crushing the rock. Owing to the great cost of crushiug, however, and the want of knowledge of working mines aud saving tbe gold, the work for a time was stopped, and the next year tbe mill was taken down and the machinery couverted to other purposes. Since tbat time considerable rock has been taken from the ledge and worked with profit. Tbe claim is on the same ledge as the Gold Tunnel and California claims.

TUOLUMNE.—The *Courier* says thnt the past few weeks have heen full of promise, and that a vast improvement in the mining affairs of that county will soon be visible. As an indication that capital is gradually going thither, the editor notices that several rich mines have lately been sold to wealthy companies and individuals, for large sums, aud hears of others being negotiated for by those who have recently been examining the various claims in that vicinity. It is claimed that there are a large number of mines in thnt county which only need to be thoroughly developed to be proved equal in value to any mines in the State. The *Courier* thinks if men of means were to take hold of these ledges with a determination to test their value, they would soon be rewarded hy dividends, and convince capitalists thnt there is no better place in which to employ money than Tuolumne county.

AMADOR.—The *Ledger* says that A. H. Rose, of Amador City, has sold the Keystone mine and mill to a San Francisco company for the sum of $120,000.

SANTA CLARA.—The San Jose *Mercury* says: "The Margarita Copper mine in this county is turning out about one thousand dollars worth of copper per day. Much of tbe rock assays as high as fifty per cent. copper."

WASHOE.

Developments along the lower levels of the Comstock, as in all the various mines where deep shafts have been sunk, tend more and more to prove the permanence of tbis celebrated lode, and its increase ia value to an illimitable depth. Like all otbes lodes, this also has its poor, aad sometimes harren streaks aad spots; but experience here, as in all other monster lodes, go to show that snch accidents are not sucb as should cause discouragement in working, or prevent a liberal outlay of capital in their development. Tbe mistake beretofore on this lode has been, that too little atteutioa has heen devoted to keepiag the mine opened ahead, so that wheu a poor place is eacouutered, it may be pusbed through und a productive portion reached nnd properly opeaed before that already developed could be worked out. Such mistakes will not soon be repeated iu Washoe. All the leadiag companies oa tbe Comstock are now pushiag rapidly downwards, and before long it is expected that several other companies will strike it rich.

The *Territorial Enterprise* gives tbe following as the last quarterly yield of the mines now beiag worked within the limits of Virginia City: The number of tons of ore extracted during tbe quarter ending August 27th, 1865, was 32,347, vnlued at $7,168,206.86. Of the 32,347 tons of ore raised here, 6,472 tons were reduced within the city liniits, nad 25,877 tons were reduced in mills outside.

The chief feature of the week has been the strike ia the Hale & Norcross. This strike was made in the lower level of tbe mine, and 700 feet below tbe surface. The Superintendeat says tbat he finds the same body of ore in an air shaft which he has been sinking from the level above to connect with the lower level to allow a free circulation of air. This, says the *Union*, is the first of tbe deep shafts to strike good ore at a considerable depth below all former lovels that have been worked, and it affords tbe the greater encouragement from the fact that this mine has never found a large body of good ore until now. This has herctofore seemed to be a barren place iu the ledge between tbe Gould & Curry aad Chollar chimuies. It is therefore reasonable to expect that the more fortunate claims on each side will find tbe ore deposits extending as far downward as where this claim first strikes it. It ought to settle the questioa in tbe minds of all doubters as to tbe deptb aud permanency of our miaes. The deposit ie twelve feet in width, and consists of ore that will make on aa average at lenst $40 per ton. It was struck thirty feet from the Chollar line, aud followed southerly a distauce of fifty feet, proving tbat claim to be good nlso at a deptb of 200 feet below its old works.

The Yellow Jacket Company are confidently expecting a large yield at their first cleaa-up in the new mill. The mill crushes and amalgamates ninety toae of ore per day. At present 146 men are employed in and about tbe mine, and 200 tons of ore are raised per day. This is doing good work. The mine looks well throughout. The company have a large number of men employed in framing the timbers for the extensive new building to be erected over their new shaft for hoisting works, blacksmith and carpenter shops, offices, engine rooms, etc. A strong force is also hard at work, grading and digging for the foundations for the heavy engiaes and other machinery.

Work is steadily going on in the Gold Hill Tunnel, and is now very near the claims of Gold Hill proper. A new contract has been let to drive the tunnel six hundred feet further. This will take it to the claims which are being worked deepest in the hill, and where tbe water in the miue has to be hoisted the greatest distauce, whicb it will strike at the depth of over tbree hundred feet, nnd serve to drain them to that depth, and be an outlet from the water raised from below. Tbe tunnel, when completed, will cnuse a great saving of wood and wear of machinery to those claims with which it will connect.

The Gold Hill *News* says that parties are at work upon some of tbe gold-bearing leads ia Devil's Gate District, some time since cursed as wild-cat, and are able to make good wages by properly assorting the ore and carefully working it in arastras. There are doubtless many claims in tbe neighborhood of Silver City that would pay well for working, provided the parties owning them possessed water-power sufficient to rua a couple of arastras. In nearly all the abaudoned claims ia the district small streaks of rock exceedingly rich in gold are to be found.

The Overman Company are aow dowa 545 feet with their shaft. They are but little troubled with water.

ESMERALDA.

Tbe Esmeralda *Union* ie iaformed by Mr. Henry Doanel, who recently arrived from the Red Mountain mines, 125 miles east of Aurora, that the prospects of the miners in that region are most flattering. Tbe three-stamp mill (steam) of McCurdy & Co. has already taken out some $2,000—crushing ore from the Jewel mine. The ore is packed about five miles and yields $50 per ton, though worked by a very imperfect process—no pans boiag used aad all the gold being saved in the batteries and upon a plate of copper charged with murcury. About one-third of the gold contained in the rock is lost in the tailings, owing to lead or other metal carrying it away. In the viciaity is a claim known as the Golden Crown Series, embraciug niue leads, all rich in gold. About ten miles east of McCurdy's mill a fine twelve-stamp mill is being erected by Mr. Samuel Martin. It will go into operatiou in a day or two. This mill is at what is called Silver Peak, and will begin crushing ore from the Vanderbilt lead, one mile in lcagth of whicb is owned by Mr. Martin. The lead contains more silver than gold.

REESE RIVER.

The *Reveille* says that the iaflux of Eastern capital into that region, together with tbe continued success of prospectors, hns given a great impetus to explorations duriag the past season, and proceeds to record the discovery of another new and promising mining district, whicb has been called the "Great Pacific." It is located in the northern end of the Egan range of mountaius, in the extreme eastern border of the State.

An English correspondent of a San Francisco daily, writing from London, under a recent date, gives the following in relation to Reese River mines now iu that market:—"Two companies bave been lately placed on the market here for erecting mills aad workiag silver mines in tbe State of Nevada. One, the Lander City Company, has a capital of $500,000, and the other at Austin, a similar amouat. The public bave, however, not come forward very eagerly, but, I believe both will he carried out by a few capitalists who have faitb in the represeatations of the vendors. Little or nothing is known here among capitalists aad business men of the rich miaes of silver and gold which are daily being opened in Nevada and Idaho, and of tbe favorable field for capital judiciously invested in the new districts. Should, however, one or two companies, witb tbeir headquarters in England, once get under way, aad realize sufficient to pay large dividends, you may depend there would be a rush to "get on," which would give a great impetus to miniag, and result largely to the prosperity of the Pacific States."

Good reports are received from the Augneta district, in Churchhill county. It nbounds in wood and water, and is but twenty miles distant from the Humboldt salt fields. It ie said that many of the quartz veins in this district run from a granite to a slate formation, without any perceptible change in their course, size or richness. Tbe Sister seriee and Augusta seriee are located in tbis district, and are well situated for working.

Blue Spring district, about fifty miles south of Austin, is well spoken of. The ledges are said to be of enormous size, from eight to thirty feet thick.

The Murphy & Garnett mine, situated on Willow creek, near Clinton, in Smoky Valley district, has recently been sold to parties in New York. From indications it is a valuable piece of property. The rock assays very bigh.

The Nye county *News*, says tbat Judge S. L. Baker, aad eome four others, intereeted with him ia miaing ground in Twia River district, have disposed of their iaterests for the sung little sum of $125,000, cash, and one hundred shares in each of the seven locations, wbich form the amount of gronnd sold. This givee eacb of the original owners $25,000 in cash, and seven hundred shares of unassessable stock. The party buying is an agent for Eastern capitalists, aud we learn will develop the claims with nll possible dispatcb.

Mr. George Hart, of Gold Hill, is now superintending the crectioa of a new mill in San Antonio district, with which will be connected furnaces for roasting the ores operated upon, end everytbing will be carried on according to the most npproved plan for the reduction of the ores of tbat district.

MINERS' LICENSE.—During the last session of Congress the Reveaue law was amended, and among other tbings a provision was added for tbe collection of liceases from miners. As there appears to be considerable misunderstanding in regard to the matter we give the law providing for tbe paymeat nf such liceuee, which reads as follows:

Miners shall pay for each and every license the sum of ten dollars. Every person, firm or company who shall employ others ia tbe business of mining for coal, gold, silver, lead, copper, iron, zinc, spelter or other minerals, not having taken out a liceuse as a mnuufacturer, and no otber, shall be regarded as a miner under this act. *Provided*, That this does not apply to any miner whose receipts from his mine shall not exceed annually oae thousand dollars.

The law exempts all miners who do not take out more than $1,000 per aanum, all who have paid licenses are manufacturers, and all who do not employ otbers in mining for tbem. One license is sufficieat for a firm or company engaged in miniag.

MINING ACCIDENT.—A miner in the Yellow Jacket mine, last Thursday, attempted to jump on a cage that was passing up the shaft from oae of the middle stations, and in so doing fell witb bis head against tbe side of tho sbaft where it was grouad by the cage until the flesh was torn completely off one side of his head and face. Had not the brakeman noticed that there was some difficulty by the hoistiag, he would probably bave been killed. He may yet recover. Tbe practice of jumping upon tbe cage from an upper level while it is ia motion ie said to be quite common at some miaes. It ie a most dangerous practice, and should never be allowed.

THE SUEZ CANAL.—The Suez Canal, connectiag the Red and Mediterranenn Seas, is advertised ae being opened on the 17th nf August. Tbe re-opening of tbis canal has been effected uader Freuch patronage, and is supposed to be a work of great commercial importance. Rollins, the ancieat historian, eays Seostris, or according to otbers, Psammeticus first projected tbe design and began this work. Necho, his successor, laid out immense sums upon it, and employed bundreds of thousande of men. Rollias says one hundred and twenty tbousand Egyptians perished in the undertaking. He gave it over, terrified by an oracle, whicb told bim that he would thereby open a door for barbarians to enter Egypt. The work was again commenced by Dariue I, bnt be was induced to suspend the work by being told tbat as the Red Sea lay higber than Egypt it would flood the country. It was however, finished by the Ptolemies. The canal was 125 feet wide, nnd deep enough to float the largest ships—which were not very big in that day. Rollius gives tbe length at 200 miles—tbough it is ouly 80. It finally got filled up, and scarcely a mark could he eeen wben tbe Frencb Emperor began to re-open it.

NEW THEORY.—A philosopher in one of the towns of New York accounts for the dearth from the great number of lightning rods there. He says these rods take tbe electricity from tbe clouds and conveyit tn the earth, so that they scatter without rain.

Mining and Scientific Press.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, Oct. 7, 1865.

RELIABILITY OF OIL WELLS.

According to the *Journal of the Franklin Institute*, one of the most reliable authorities extant, petroleum even now deserves to be ranked with coal and iron, as a substantial mining interest. Experience thus far has almost universally proven that when petroleum becomes exhausted in shallow wells it may be found even more plenteous in deeper ones. According to the journal now before us, the wells of the famous Oil Creek region, in Pennsylvania, were first sunk to a depth of only about two and three hundred feet, at which depth a heavy lubricating oil was generally obtained, but mostly in small quantities, and usually only at the expense of pumping. These wells were gradually exhausted and abandoned; but subsequently the same borings, or new ones, were put down to a depth of from five to six hundred feet. It was those *deep* wells, principally, which yielded such immense quantities of oil by flowing—some yielding as high as 1,000, 2,000, and in some cases exceeding 3,000 barrels every twenty-four hours. The journal we are quoting says that of 340 wells sunk previous to the date of the article before us, between the Humboldt Refinery and Roseville, all that have reached the proper depth have produced oil, and the remainder, numbering 112, were then expected to experience equally good fortune. The above is, in substance, the answer which the *Journal of the Franklin Institute* gives "to those who are fearful that petroleum is giving out." This answer may well serve as an encouragement for California prospectors to persevere wherever there is found a reasonable indication for the existence of oil. If found in any particular locality, it may reasonably be looked for throughout the entire extent of that geological section. In this particular petroleum is altogether different from mining for silver or gold. It is as reliable as coal or iron, and is as sure to return a profit to intelligent investment, as the planting of wheat or corn. The fact that it forms the basis of numerous wild-cat operations, is no argument against legitimate investments.

A NEW SOURCE FOR OBTAINING COAL OIL. Dr. Benoist, the pioneer coal oil distiller of the Pacific coast, says the *Flag*, has been for some months past engaged in making experiments for the purpose of obtaining coal oil from the tar produced by the local gas companies in making gas. We are pleased to learn that his experiments are likely to be successful.

IN our notice of Mr. Jas. Macken's copper works, last week, we should have mentioned that he does a large amount of work for sugar manufacturers in the Sandwich Islands.

PROCESS OF DISINFECTION.

The following memoranda on disinfection have just been issued by the English Privy Council; and, considering the circumstances under which they are published, we feel bound to assist in giving them all publicity. They may be found of especial value at the present time, while an unusual amount of attention is being directed by our citizens to a reorganization of the Board of Health of this city, and to the necessity for a thorough reform in our health regulations, by which the foul alleys, filthy yards and disease-engendering courts, which so abound, may be removed from our midst. It is terrible to reflect what might be the result if some sudden contagion should appear among us in our present condition. Measures should be taken at once to purify the city by a thorough cleaning of all the alleys, courts, lanes, and yards throughout the city, where such renovation should, in the opinion of an intelligent Board of Health, be deemed advisable. In this connection the following memoranda, prepared with great care, may not be out of place or time:

"1. For purposes of artificial disinfection, the agents which most commonly prove useful are—chloride of lime, quicklime, and Condy's manganic compounds. Metallic salts—especially perchloride of iron, and chloride of zinc, are, under some circumstances, applicable. In certain cases chlorine gas or sulphurous acid gas may advantageously be used; and, in certain other cases powdered charcoal or fresh earth.

"2. If perchloride of iron or chloride of zinc be used, the common concentrated solution may be diluted with eight or ten times its bulk of water. Sulphate of iron or chloride of lime may be used in the proportion of a pound to a gallon of water, taking care that the water completely dissolves the sulphate of iron, or has the chloride of lime thoroughly mixed with it. Condy's stronger fluid (red) may be diluted with fifty times its bulk of water; his weaker fluid (green) with thirty times its bulk of water. Where the matters requiring to be disinfected are matters having an offensive smell, the disinfectant should be used till this smell has entirely ceased.

"3 In the ordinary emptying of privies or cesspools, use may be made of perchloride of iron or chloride of zinc, or of sulphate of iron. But where disease is present, it is best to use chloride of lime or Condy's fluid. Where it is desirable to disinfect, before throwing away, the evacuations from the bowels of persons suffering from certain diseases, the disinfectant should be put into the night-stool or bed-pan when about to be used by the patient.

"4 Heaps of manure or of other filth, if it be impossible or inexpedient to remove them, should be covered to the depth of two or three inches with a layer of freshly burnt vegetable charcoal in powder. Freshly burnt lime may be used in the same way, but is less effectual than charcoal. If neither charcoal nor lime be at hand, the filth should be covered with a layer some inches thick of clean dry earth.

A PETROLEUM CONVENTION IN HUMBOLDT. A Convention of petroleum miners has been called to meet at Petrolia, in Humboldt county, on the 19th inst., for the purpose of considering the subject of the titles to their lands, and taking other action in regard to the interests of their occupation. The coal oil business appears to be undertaken in earnest in that county, and so confident are they of success that they wish to take measures for obtaining from Congress a recognition of the validity of their claims. The valuation of property in Humboldt has increased thirty per cent. during the last year, the largest increase in the State. The oil has been found in a number of places, and it is presumed that enough will soon be obtained to send a regular supply to the market.

A NEW PROJECTILE.—It is well known that if a few grains of fulminate of mercury be placed upon an anvil and struck with a hammer, a piece will be taken out of the anvil. It is proposed to make use of this fact in gunnery, by placing upon the tip of any elongated projectile a thin coating of this detonating compound (which is the same now used in percussion caps,) and it is supposed that no iron plating can withstand its force. The experiments which have been tried with the fulminate of mercury with rifle projectiles have been successful in piercing a boiler-plate target.

A Query.

MESSRS. EDITORS:—As Mr. Mosheimer appears to be well posted on concentration of copper ores, and as his article, as published in your issue of September 30th, is not as full as might be desirable to the generality of miners, I should be glad if he would furnish us with the best methods of concentrating, by water, such ores as the following:

1st. Ores containing, besides sulphur, only arsenic and iron.

2d. Carbonates and oxides of copper, mixed with oxides of iron and with lime.

3d. Oxychlorides of copper, intermixed with quartz.

AN EXPERIENCED MINER.

THE WATER MONOPOLY.—We hear almost universal complaint among all classes of landlords and tenants of the extortionate price of water. Since the combination of the two water companies the rates have been doubled and in many instances trebled. The cost of water now is nearly as high as gas in many of the Atlantic States. Many of the large property owners are protecting themselves against this imposition by sinking wells, but the poor not having the means to do so are the victims of the monopolists. The Cosmopolitan Hotel is supplied with excellent water by means of an Artesian well, which cost but a trifle in comparison to what would be the expense of a supply from the Water Company at the rates it charges poor families. So says the *Flag*; in all of which we fully concur.

BREEDING GOLDFISH.—The Virginia *Enterprise* is informed by Mrs. L. S. Bowers, of Virginia City, that in some artificial ponds near her residence she has a perfect school of goldfish of all sizes and ages. The ponds are filled with water from a large hot spring, near at hand, and cooled to a genial temperature by cold water from other springs in the immediate vicinity. Several goldfish were originally put into the ponds, less than two years ago, and they now contain between five hundred and one thousand of these beautiful fishes.

THE LATE EARTHQUAKE AT THE NORTH.—An earthquake shock, the severest which has been felt within the memory of the oldest inhabitant, was experienced in Eureka, in Humboldt county, about 9 o'clock on Sunday morning last. According to the *Call*, the first disturbance of the earth occurred about a quarter past 9 o'clock A. M.—the vibration being from south to north, and lasting about eight seconds. This was followed by a second shock from the same direction, which endured about the same time. There was scarcely a house in the town that escaped fracture in its brickwork. The chimneys of the Russ House, the principal hotel in the place, were razed close to the line of the roof; and the Court House shed its plastering like leaves in Autumn weather. All the chimneys in this building were damaged. The steeple of the First Congregational Church swayed to and fro like a reed in the wind; and in the forests of redwood which lie adjacent to the town, many a majestic tree was uprooted and fell crashing to the earth. In private houses and stores more or less loss was experienced—the damage in some of the latter being estimated as high as two hundred dollars. Fort Humboldt, a military post situated a few miles below Eureka, on the Bay, was even more roughly handled than the town. At the time of the earthquake the troops were on parade, and their attention to the orders of the officer of the day was distracted by finding a crevice about two inches in width opening at their feet, along the extent of the parade ground. Their consternation was extreme, and they skedaddled without waiting for permission to that effect.

EFFECT OF NATURAL ELECTRICITY ON TELEGRAPH WIRES.—During a late tornado in Minnesota the telegraph wires were stretched sixty feet. When found by the repairer, the wire, though disconnected from the main battery, was so charged with electricity that it communicated a severe shock nineteen hours after the storm had passed. It is supposed that the wire was so overcharged as to become red hot, and in that condition stretched by the sheer force of the wind.

TREASURE EXPORT BY THE CONSTITUTION. The Pacific Mail Steamship Constitution sailed for Panama on Tuesday last, with a large list of passengers and $1,509,594 in treasure—$1,112,312 of which goes to New York.

IMPROVED REFRIGERATORS.—Mr. W. S. Rowe, of this city, has recently invented quite an important improvement, designed originally for application to milk-pans, but which is equally applicable to various other purposes, where a moderate degree of refrigeration is desired. This improvement, as applied to milk-pans, consists in a conical-shaped cover, with a chimney of six or eight inches in height, covered by wire net-work, and springing from its top. Around the lower portion or the base of the cover, several clusters of small holes are made, by which, in connection with the chimney, a draft is established, sufficient to cause a thermometer to fall from ten to fifteen degrees, in the space of as many minutes, when suspended within the pan. By this decrease of temperature, a much larger amount of cream is obtained than by using the ordinary pan, while the same is kept perfectly free from vermin and insects. We have ourselves tried one of these pans, and can fully attest to its great superiority over those in common use. The increase in the amount of cream produced will soon pay the cost of the pan, to say nothing about the advantage of cleanliness. It is especially valuable for preserving meat, as by its use fresh meat may be kept about one-half longer than in the open air. This principle may be applied to any other purpose of moderate refrigerating or thorough ventilation. Mr. Rowe has applied it to hats, ordinary refrigerators, covering for cradles, and for ventilating dwellings, public buildings, etc. A large number of persons have used the pans, and all, without exception, speak in the highest terms of their utility. They may be examined and obtained at Osgood & Stetson's, 219 Commercial street, in this city.

A NOVEL UMBRELLA.—The latest wonderful discovery announced is by a Frenchman, who claims that by an application of electricity to a small mechanical apparatus, that can be carried in the end of a walking stick, and by holding the same, so prepared and charged, over his head after the manner of an umbrella, he can avert the rain entirely from his person. He is said to have repeatedly tested the efficiency of his electrical apparatus by passing through the streets of the place where he resides, during a heavy rain storm, with his cane held after the manner of an umbrella, when by some unseen agency the particles of water are repelled in every direction from the point of his cane, whilst he walks through the midst of the shower without being wetted by the falling water.

DIVIDEND PAYING INSTITUTION.—In the New York *Stockholder* of August 15th, is the following announcement:

The New York and Reese River [Midas] Mining Company will pay their second quarterly dividend of three per cent. in gold, at 30 Pine street, on and after the 1st of September next.

The above, says the Reese River *Reveille*, ought to convince Eastern capitalists that a good field for investment is open in the silver mines of that State. One per cent. per month in gold is a large rate of interest in the East, —on a greenback capital. The mill will probably pay an increased dividend hereafter as a large amount of money has been paid out in the purchase of mines and in conducting lawsuits.

THE LATE EARTHQUAKE ON THE MISSISSIPPI. The late earthquake on the Mississippi, appears to have been one of unusual severity, and to have been attended with some remarkable phenomena. At New Madrid the waters of the Mississippi rose several feet in hight—the water, in fact, was forced backward, up the stream, the current being actually stopped during the continuance of the shock. Several chimneys were toppled over in Memphis, and considerable plastering was knocked down. While it was so sensibly felt in the houses it was scarcely perceptible in the streets.

THE NEW OVERLAND TELEGRAPH LINE is now in active progress of construction. It was expected that in twenty days from the 30th of August last, the United States Telegraph Line would be completed to Kansas City.

LIST OF OFFICERS OF MINING COMPANIES AND INCORPORATIONS.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

Blue Ledge G. & S. Quartz M. Co.—August 30th. Trustees: Aug. C. Teitman, A. Walrath, W. H. Lyon, N. E. Grimes, James S. Kennedy. President, Aug. C. Teitman; Vice President, A. Walrath; Secretary, J. M. Buffington; Treasurer, W. H. Lyon; Superintendent, William S. Moses.

Harmon G. & S. M. Co.—August 2d. Trustees: B Dore, C. H. Aitken, A. J. Downer, John Patterson, Isaac Taber, Wm. H. Davis, J. W. Epley. President, B. Dore; Secretary and Treasurer, T. J. Jones; Superintendent, John Householder.

Keokuk Mining Co.—August 9th. Trustees: H. T. Graves, H. D. Ellerhorst, R. W. Addis, G. W. Peterson, A. B. Winegar. President, H. T. Graves; Secretary and Treasurer, A. B. Winegar. Office, 308 and 310 Front street.

Kentucky Copper M. Co., Copperopolis, Felix District.—Sept. 5th. Trustees: B. Lutofs, Henry Voormann, Samuel Grosh, C Aug. Weihe, J. A. Bauer. President, Bd. Lutofs; Secretary and Treasurer, J. A. Bauer; Superintendent, C. W. Lewis.

Lizzie G. & S. M. Co.—March 6th. Trustees: Horace Peter, W. H. Allen, C. M. Service. President, Horace Peter; Secretary and Treasurer, W. H. Allen; Superintendent, D. B. King. Office, 502 Montgomery street.

Mechanics' Mining Co.—August 9th. Trustees: F. Locke, H. D. Ellerborst, S. M. Tibbetts, H. T. Graves, A. B. Winegar. President, H. T. Graves; Secretary and Treasurer, A. B. Winegar. Office, 308 and 310 Front street.

Mina Rica de las Flores M. & M. Co.—August 23d. Trustees: Mullot aine, B. Pasquale, J. Foa, A. Rochebrune, L. Blanebard, C. Guilhard. President, Mullot aine; Secretary, S. Dickinson; Treasurer, Alfred Borel; Superintendent, A. Bouglinval.

Sophia Cons. G. & S. M. Co.—Sept. 4th. Trustees: J. S. Josephi, Ad. Unger, H. Loewy, Wm. Fisbel, J. E. de la Montagnie. President, J. S. Josephi; Secretary, D. E. Josephi; Superintendent, Charles Sell.

Seaton Mining Co.—Sept. 13th. Trustees: C. H. Bradford, Wm. Thompson, Jr., C. J. Hutchinson, Mark L. McDonald, G. W. Seaton. President, C. H. Bradford; Secretary and Treasurer, S. T. King; Superintendent, Wm. H. Hepburn.

Santa Cruz Petroleum Oil Works Co.—Sept. 26th. Trustees: Col. Leander Ransom, N. C. Walton, A. Walrath, Y. Martenstein, Dr. B. F. Hardy. President, Col. Leander Ransom; Vice President, Dr. B. F. Hardy; Secretary, R. Wegener; Treasurer, A. Walrath; Superintendent, N. C. Walton.

RECENT INCORPORATIONS.

Alpha Mining Co., Gold Hill, Storey County, Nev.—Sept. 26th. Trustees: Chas. Bonner, Geo. B. Reeve, Louis Gerstle, O. A. Sanborn, Alex. W. Baldwin.

Bennett Oil Co., San Mateo Co., Cal.—Sept. 2d. Trustees: A. M. Winn, W. W. Bennett, Wm. Sublitt, Wm. T. Randall, A. G. M. Bowen.

Confidence S. M. Co., Gold Hill District, Storey Co., Nev.—August 11th. Trustees: John Macdonald, Jr., Wm. Surryhue, S. B. Whipple, John H. Todman, J. Greenbaum.

California Petroleum Rectifying Co.—August 25th. Trustees: L. Tichner, Jas. Anderson, H. T. Graves.

Comet Petroleum Co., Mattole District, Humboldt Co., Cal.—August 1st. Trustees: Geo. R. Paul, Robert Kirk, Wm. Vale.

Eel River Oil Co., Eel River District, Humboldt Co., Cal.—Sept. 11th. Trustees: J. L. Cresett, W. B. Ewer, Charles J. Barber, E. H. Wilson.

Emerald Copper M. Co., Empire District, Yuba Co., Cal.—August 23. Trustees: John P. Jones, Thomas Hardy, Jas. A. Pritchard.

Fortuna Consolidated G. M. Co., Soulsby Mining District, Tuolumne Co., Cal.—August 4th. Trustees: F. Hagerman, J. Stock, C. Spreckels, F. Kaiser, A. Haag.

Forks of the Mattole Oil Co., Humboldt Co., Cal.—Sept. 30th. Trustees: J. C. Birdseye, William Laugerman, Louis Cohn, T. J. L. Smiley, E. R. Burke.

Flowing Well Oil Co., San Mateo Co., Cal.—August 10th. Trustees: Robt. L. Horton, M. J. Kennedy. John J. Mills, Wm. S. Prince, Eugene Walker.

Gem Petroleum Co., Bear River District, Humboldt Co., Cal.—Sept. 8th. Trustees: J. H Brass, H. H Ricker, N. B. Crummer.

Gould Oil Co., Mattole District, Humboldt Co., Cal.—Sept. 13th. Trustees: George S. Gladwin, Chas. M. Haley, Chas. W. Newman.

Howarn & Martin Petroleum Co., Mattole Distriet, Humboldt Co., Cal.—August 1st. Trustees: M. S. Martin, H. C. Howard, J. Lyon.

Hawley Farm Oil Co., Bear River District, Humboldt Co., Cal.—August 4th. Trustees: J. C. Birdseye, C. N. Felton, Louis Cohn, W. Langermann, T. J. L. Smiley.

Kentuck M. Co., Gold Hill Distriet, Storey Co., Nev.—August 22d. Trustees: S. Wood, E. W. Teackle, H. E. Greene, Thos. Sunderland, Joseph French.

La Golita Petroleum Co., State of California.—Sept. 26th. Trustees: Lester L. Robinson, Francois L. A. Pioche, Romain Bayerque, Samuel L. Theller, Asher B. Bates.

Lyon Petroleum Co., Mattole District, Humboldt Co., Cal.—August 1st. Trustees: M. S. Martin, H. C. Howard, Joshua Lyon.

Leon S. M. Co., Columbus District, Esmeralda Co., Nev.—August 29th. Trustees: J. Francisco de Leon, Vincente Oviedo, Manuel Madero, Frank R. Larkin.

Merchants' Petroleum Co., Botts District, Colusi Co., Cal.—Sept. 15th. Trustees: C. W. Kellogg, W. S. Havens, C. C. Burr.

Mechanics' Petroleum Co., Autelope Petroleum Mining District, Colusi Co.—Sept. 15th. Trustees: C. W. Kellogg, W. S. Havens, C. C. Burr.

Mattole Creek Oil Co., Mattole District, Humboldt Co., Cal.—Sept. 15th. Trustees: Henry Palmer, W. K. Flint, E. C. McComb, Edward F. Stone, Geo. W. Beaver.

Pacific Petroleum Co., Redwood Township, Santa Clara Co., Cal.—Sept. 4. Trustees: Jules Foa, J. M. Villeneuve, D. M. Harwood.

Pioneer Petroleum M. Co., Mattole District, Humboldt Co., Cal.—Sept. 11th. Trustees: J. B. Pierce, Joel Halsted, William E. Straut, Charles Suttou, Jr., James S. Beardsley.

Sheridan Cons. Petroleum Co., Humboldt Co., Cal.—August 24. Trustees: Charles F. Robinson, A. L. Hart, G. A. Ensign.

San Ramon Oil Co., Napa Co.—Sept. 26th. Trustees: Juan B. Peralta, Manuel Madero, Nicolas Dabovich.

The Play Book of Metals.—This is the title of a very curious and useful little work, which should find its way into every household and school library. Its writer is John Henry Pepper, the author of the "Play Book of Science." The aim of the writer has been to select from the immense stores of our information with regard to metals and mining that class of facts which is best calculated to please and interest the young, and thereby instill into their minds a love for useful and practical information. All who have arrived to the age of maturity are well aware of the difficulty with which the attention of young people is drawn to the dull details of most subjects of science, and the facility with which the same youthful minds become interested in the more attractive subjects embraced in the light literature of the day. With the hope of doing something to change the dangerous tendency of the literary taste of the day, the author of the "Play Book of Metals" has endeavored to carry the reader through the somewhat tedious and lengthy history and philosophy of the metals, by clothing his instructions in familiar language, combining, wherever practicable, the idea of amusement with instruction, and interspersing the same with numerous pictorial illustrations as helps to the memory and pleasure to the eye. So well has he succeeded in this effort, that by merely looking through the pictures of this book, a person may gain at a glance the first and most simple rudiments of a knowledge of the metals. While this work has been more particularly adapted for the young, it will also be found of much practical value to the adult. By its perusal and study a vast fund of information may be obtained with regard to the science of the miperals and metals; the numerous, useful purposes to which they may be applied, their mechanical and chemical structure, composition, etc. A large number of useful and interesting chemical experiments are described and familiarly illustrated—such as may readily be performed in the family circle or miner's cabin. The work comprises about 500 pages illustrated by 300 engravings, and may be obtained of A. Roman & Co., in this city.

SODIUM AMALGAM AN AMERICAN DISCOVERY.

Since making the announcement of our intended experiments with the use of sodium amalgam, we have received a call from Dr. A. F. W. Partz, of the firm of Partz & Buck, assayers, New York, from whom we have learned that there is an American patent on the use of sodium and potassium amalgam for the amalgamation of the precious metals. The discovery of the use of this new aid to the process of amalgamation was made by Prof. Henry Wirtz, of New York city, a native of this country, and hence it is an American invention. The patent was obtained about a year ago, although the discovery was made some four years since. This, it will be seen, long antedates the reported English discovery, lately announced in the London *Chemical News*. The patent is now in the hands of a company, known as the "Wirtz Amalgamation Company," of which our informant, Dr. Partz, is a member. The inventor has been occupied, more or less, for the past two years, in making an elaborate series of experiments, with the view of showing the utility and proper use of this new aid to amalgamation. The delay in the introduction of the invention has been chiefly owing to the difficulty at first encountered in procuring sodium in sufficient quantities for practical use. That difficulty is now entirely removed, and the metal can be readily obtained, at moderate cost, to any desired extent. The experiments are now so far completed that they are making arrangements to introduce their discovery to the mining public, which will soon be done on a scale of liberality which will doubtless induce its general introduction, and remove all disposition on the part of any one to make any covert use of this important discovery. As soon as the necessary preliminaries are completed, we shall make the same known through the columns of the Mining and Scientific Press, together with a full and detailed account of the elaborate experiments which have been so long in progress, under the especial supervision of the inventor. For the reasons above set forth, we have deferred any experiments of our own, as proposed in our issue of the 23d ult., preferring to accept results direct from headquarters.

A Celestial Visitor Approaching.—Biela's comet, now approaching its perihelion, will soon be visible. It is now distant about 110,000,000 miles. On the first of November next it will be close to *Alpha Pegasi Markab*, one of the four bright stars forming the well known square of Pegasus. It then pursues a southerly course, crossing the celestial equator about the middle of December. It then crosses its old path in 1864, near where it separated into two comets. At the end of February its distance from the earth will be less than 20,000,000 of miles. This comet's period is about six and three-quarter years.

Godey's Ladies' Book.—We have received the September and October numbers of this useful and interesting publication, published monthly, at Philadelphia, and edited by Mrs. Sarah J. Hale and Louis A. Godey. This standard publication has now reached its seventy-first volume, and is one of the best conducted publications of the kind in the world. It is ever rich and replete with everything that should make it a welcome visitor to every center-table. The Lady's Book is furnished for $3 a year, or $5 50 for two copies to one address.

A Mining Stock Board has been established at Colorado, to be known as the "Mining Board of Gilpin county, Colorado. It is organized upon a basis similar to the Mining Boards of this city. Any persons wishing to transact business with this Board should address George E. Wilson, Corresponding Secretary, Denver, Colorado.

A Fossil Man.—The Abeille *Bugey* says that "a fossil man has just been dug up in a bed of drift, between Veyziat and Oyonnax, near Nantua, (Ain). The body was found in an inverted posture, but the bones did not adhere together, and were brought out one by one."

IMPORTANT MINING SALE.

We have already stated that negotiations were in progress by certain parties in this city and Grass Valley for the purchase of the Eureka mine, Grass Valley, which has been owned and worked for several years by Jules Fricot & Co. This mine was worked for several years at an inconsiderable depth only, the rock paying but a little over expenses. Soon after it came under the management of Mons. Fricot, (familiarly known as "the Emperor,") that gentleman, with characteristic liberality and energy, determined upon its thorough development in depth. His judgment and perseverance were most amply rewarded, in proving the existence of one of the most valuable mines on the Pacific coast. After sinking to the depth of about 200 feet, the prospects were such as to warrant his putting up expensive machinery for hoisting and crushing, which machinery went into operation last spring. For the last three or four months the mill, crushing but twenty tons per day, has realized a net profit to the company of $25,000 per month. The ore now being raised from the 200 foot level is paying at the rate of $50 per ton.

The parties into whose possession the mine has just passed are the brothers Watt of Grass Valley, and several San Francisco and New York parties, who have purchased, not for speculation, but with the view of a permanent investment. The amount for which it was sold is $400,000 in gold, the first instalment of which has been paid. The property is divided into twenty shares of $20,000 each—unincorporated—and carries with it, besides the mine, one of the finest and most substantial mills in California, capable of reducing about twenty tons of ore per day. This capacity will soon be increased, by the new proprietors, to double that amount. The Messrs. Watt, who have been long connected, as the managing partners, with another Grass Valley mining company, and one of the most successful in the State, are to have the immediate charge of this new property. Under their management, it cannot fail to prove a most profitable investment, and add largely to the already well established reputation of Grass Valley, as the most important mining town in California.

The Hanscom Copper Mine.—Gradually, but steadily, our productive copper mines are increasing in number. One of the latest valuable strikes we have to record is that of the Hanscom Copper Mine, in Low Divide District, Del Norte county. This company have been running a tunnel for some two years, and finally, at a distance of 440 feet, recently reached the lode at a depth of 175 feet. The lode opens eighteen inches thick, twelve inches being deep yellow or bronze sulphuret ore, with three inch veins of black oxyd on each side, accompanied with all the evidences of a permanent, well-defined ledge. The ground is favorably located for prosecuting the work to advantage. Assays made in this city, from average samples of the sulphuret ore, show a yield of about 27 per cent. copper. From our own observations, we are led to believe that the Hanscom has been one of the most economically managed mining corporations in this city, and for that, as well as other reasons, we shall expect soon to see it rank among the first-class of paying mines. This development of the Hanscom mine affords encouragement for neighboring miners to prosecute their work with vigor. We have long maintained that an intelligent and economical outlay of capital is all that is necessary to make Del Norte county famous for its rich and profuse deposits of copper ore.

Rare Mineral.—The Austin *Reveille*, of September 1st, says:

We were shown to-day by Riotte, at Theall & Co.'s assay establishment, several fine specimens of a rare and beautiful mineral known as molybdenite, which is the constant and invariable companion of tin ore. This mineral is found in specimen in Cornwall, but more frequently and in larger masses in Altenberg, in the district of Freiberg. Its presence here would lead us, reasonably enough, to anticipate the discovery of tin ore.

A SIMPLE PROCESS FOR EXTRACTING COPPER FROM ITS POOR ORES.

The importance of some process by which the enormous quantities of poor copper ores annually raised from our mines, and at present of little or no value, is so generally admitted that much interest naturally attaches to every possible invention and experiment bearing upon this subject. It is with this view that we give the subjoined "process;" not because it is anything especially new, but because of the experimental data which has been furnished in this connection by W. J. March, C. E. These experiments were made in the Atlantic States, but where we are not informed. In localities where timber is abundant, and where old iron can be obtained at a cheap rate—either scrap or cast iron—we see no reason why the process may not be employed with a good degree of success and economy. We would suggest that some of our copper miners should institute a series of experiments similar to those detailed below, and send a report of the same to this office for publication. If the experiments are undertaken, let us have the results, whether favorable or otherwise. We trust that some one of the many who may be favorably situated, may act upon our suggestion; and that ere long the profitable treatment of much of the poorer class of our copper ores, now a positive inconvenience at many of our mines, may be demonstrated by actual experiment.

This process for working up copper ores that are too poor in metal to bear transportation from the mines, is very old, and has long been practiced in Europe. Yet its introduction into this country, I believe, is new; and with the alteration of a few of the details that I have made to it to render the operation more speedy, will make it a very desirable acquisition to a great many of the mines in this country.

Its simplicity, and also the trifling expense at which it may be started and kept going, is also a great recommendation in its favor.

It consists simply, first to convert the ore into a sulphate by burning in heaps with brushwood, or roasting in a furnace; then lixivating the burnt ore, and precipitating it with old iron.

In order to comprehend the details of the operation more readily, I will give them separately.

1st. *Roasting or Calcining the Ore.*—The entire success of the whole process will depend upon this being well done. In the first place, the ore should contain from 20 to 30 per cent. of sulphur, either mineralized with the ore, or in the state of mundics, or pyrites; should the ore not contain the requisite amount, mundics, or pyrites, must be added to it; should there be more, it will be all the better, only more liable to melt.

I have found twenty-five tons to a heap the best size for complete work at a single roasting; I therefore give the dimensions for that size:—

First, six logs about a foot or nine inches through, and twelve feet long, must be laid iron works best in cold water.

The iron is put in proportion of about four pounds to the gallon; it should be disposed in the tubs in such a manner as to expose as much surface of metal to the action of the water as possible, and to reach nearly to the top of the tub, as the strongest action is from the surface to the centre.

As there is usually two or three parts of sulphate of iron to one of sulphate of copper present, the solution consequently does not remain long clear. While it froths freely, it is doing very well; but when the sulphates commence to crystallize on the surface, and slimy flocks of hydrate of iron are seen floating about, the iron must be taken out, the water allowed to settle, and the clear portion of it syphoned off; the remainder, which is principally sulphates, and hydrate of iron, by filling up again with clear water, are re-dissolved, and so much disseminated, that, by putting back the iron, the remainder of the copper in solution is soon precipitated.

In the water that has been syphoned off, more iron is added, and it will precipitate itself without further trouble.

When the water will no longer coat a knife blade, the copper is all out of it. In cleaning off, the iron is scraped clean of the copper attached to it, and put aside for further use. If it is intended to convert the mother water into crystallized sulphate of iron (copperas), the clear portions must be only used for that purpose. The remainder is diluted until the copper is washed clean from the hydrates and carburets of iron. It is then ready for melting into ingots, or boxing up and selling to the parallel to each other, and a little over two feet apart, so as to cover an area of twelve feet square. (The logs may be in two lengths, and placed end to end.) The vacancies between the logs must be filled with small dry wood that will kindle easily; then covered with poles or rails twelve feet long, and three to six inches through, laid across the logs and close together, in order to prevent the ore from falling through too soon. Then throw a layer of brushwood on the platform thus made, and cover it with ore, and keep putting on alternate layers of brushwood and ore, sloping in the side about 50 to 55 degrees, until the twenty-five tons is all on the heap, it will then be about eight feet high. It is now finished, and can be set on fire at pleasure; firing the alternate ends of the five furnaces, three to windward and two to leeward. It must be allowed to burn until it goes out.

Larger sized heaps should have chimneys through them, made by placing three good-sized poles together on end in the heap. Even one or two in the above size heap I believe is a great advantage.

If the ore does not contain above 4 or 5 per cent. of copper, one burning, if well done, will be sufficient to convert it all into sulphate—should it contain above that amount, it will take from two to three burnings.

Roasting the ore in a reverberating furnace would be much more complete and speedy, but the cost would be much increased.

2d. *Leaching the Burnt Ore.*—After the ore has become cool, it is thrown into large hoppers, and warm water thrown on it at regular intervals, sufficient to keep it running steadily. Cold water will answer, but the warm dissolves it more rapidly, and it is sooner leached out. The water can easily be warmed by plunging hot iron into the buckets before throwing it on the hoppers.

The hoppers are kept running until the water from them becomes so weak as to hardly coat a knife blade; the hoppers should then be emptied and a fresh charge of unleached ore be supplied.

3d. *Precipitating the Solution.*—The solution as it comes from the hoppers is thrown into barrels, tubs, or vats of any convenient size, to which is added old iron, such as broken castings, and scrap iron of any sort; but cast-smelters.

I have found the precipitation is very much hastened by putting the solution and iron into a copper boiler, and keeping it almost to a boiling heat until the copper is all out, merely taking care that the solution is not enough to throw down too much hydrate, which retards the work.

A fifty-gallon tub would take about eight days of summer weather to precipitate into cold solution, while a fifteen-gallon boiler would precipitate forty-five gallons in twelve hours, and use a smaller proportion of iron to work with.

It takes one pound of iron to precipitate a pound of copper, there being considerable waste through "graphite" and other impurities in the iron.

The cost of working this process would of course vary in different sections of country, but in order to give some idea of its trifling expense, I subjoin the costs of three lots that I manufactured with particular attention as to the expense; merely prefacing that the ore I used was a mixture of decomposed sulphurets, taken as it came from the mine, and required no addition of sulphur being made to it:

	No. of Tons Burnt.	Percentage in Copper.	Percentage in Sulphur.	Number of Times Burnt.	Cost of Burning per Ton.	Cost of Leaching and precipitating a Ton.	Pounds of Iron used per Ton of Ore at 2c. per lb.	Pounds of Copper made to Ton of Ore.	Total Cost per Ton.	Total Value per Ton.
No. 1	20	3.00	35.00	1	7½c	$1,40	64	53	$2,75½	$ 13,25
No. 2	10	6.00	40.00	2	8c	1,65	120	96½	4,21	24,12½
No. 3	6	8.00	50 00	2	8½c	1.90	145	101½	4,97	26,12½

I should have remarked, under the head of burning the ores, that the very sulphurous ores being easily fused, are apt to deposit more or less regulus at the bottom of the heaps; this, it is needless to say, should not be put into the hoppers. Yet, as it is usually several times richer in metal than the ore, it may, if rich enough, be sold to the smelters in that state. But if too poor to bear transportation, it can be put in the bottom of the next heap, where it will be re-melted, and come out rich enough next time.

In No. 1, I found 600 lbs regulus containing 7.30 per cent. copper.

In No. 2, in the second burning, I had 400 lbs of 13.25 per cent. copper.

In No. 3, in the second burning, I had 560 lbs of 14.00 per cent. regulus.

A neighboring company, in a heap of about 40 tons of 9.00 per cent. ore, procured 1,800 lbs. of regulus, that reached 15.00 per cent. in one burning.

There is a small percentage of loss as given in the original table, accompanying the article, which we copy from the *Mining Magazine* of New York; but its detail is evidently accompanied with an error which makes that portion of it of no value. The "loss" by this process, when closely manipulated, need not exceed the half of one per cent. of the assay. Any person may conveniently arrange a "hopper," or simply an inclined table, upon which the sulphates may be placed for lixivation, and from which the solution may be conveyed by troughs to any convenient receptacle. A barrel, or series of barrels, may be used. If any party who will undertake the experiment should be desirous of further information, we will cheerfully give it in writing, together with a rough draft of the arrangement of hoppers, barrels, etc.

New Volume

— OF THE —

Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).

PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers,
505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the Mining and Scientific Press commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News dealers, acting as our agents, will receive liberal commissions.

Rowe's Patent Æolian Refrigerator.

THIS NEW AND IMPORTANT INVENTION IS NOW offered to the public, with the fullest conviction that it will be found invaluable to the dairyman, and of most essential service in every household. By its use the amount of cream from milk may be increased nearly one-third in quantity, while for general refrigerating and ventilating purposes, it has no equal. Call on OSGOOD & STETSON, 219 Commercial street, San Francisco, and examine for yourselves.
14v11 W. S. ROWE, Proprietor.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. R. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

Dentist Work.—Messrs. Knowles & Clark have an improved method of combining their gold and vulcanite material in the manufacture of dentistry, which renders the work superior in finish and durability. The samples of their hand-work on exhibition at the late Fair were much admired, and we observe that they were awarded a first premium diploma.

The Black Hawk Mining Company of Colorado, whose mills and other property was recently valued at $2,500,000, has shut down because it cannot pay expenses. The trouble is bad management. The mine paid well a couple of years ago, when in the hands of private parties.

The Reese River *Reveille* understands that General Dunn will make Austin his permanent home. He has purchased the Union quartz mill, one of the first erected in that place, and will manage that and the mines belonging thereto.

The Latest "Dodge" of the match manufacturers to avoid the internal revenue tax is to make long matches and dip both ends in the brimstone. They must then be broken in two before they are used.

Treasure Receipts.—The receipts of treasure from the interior for the month of September, aggregate $4,000,000.

Narrow Escape from Drowning in a Mine. During the recent flood in Ohio, the water broke into the Muhoning coal mine, in which four men were at work. They climbed to the top of the slope and managed to keep from drowning, and fortunately as the river fell the water stopped flowing in. They remained thus walled in until parties above bored down fifty feet to the top of the slope. Two of them became insensible, and in the meantime they were attacked by swarms of rats which were driven out of their burrows by the water; but the vermin were kept off by a dog. All were eventually got out alive.

An Indian's Idea of Machinery.—Some chiefs of Canadian Indians, a few days ago, saw a sewing machine in operation for the first time. One old chief, with a lamp, watched the motion beneath the table, and the rest kept their eyes upon it above, to see there were no "white lies" about it. They then compared notes, threw themselves upon the floor and rolled about laughing and crying out, in Indian, the "Sewing Spirit." They had no idea that it was the spirit of man's intelligence which put it in such successful motion.

Bad for the Blood.—The Prince of Wales won't go to the naval fetes at Cherbourg, because there will be no Prince of the blood to receive him; and the French Minister of Marine (Laubat) also refuses to go, because there will be no English Lord of the Admiralty present.

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the Mining and Scientific Press can be accommodated by calling upon our Agent, Mr. Turner Hamilton, at the Assembly Building, 108 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

STOW'S

PATENT CHAMBER DRILL.

THE GREATEST LABOR-SAVING ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 1⅞ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Lluscott's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for $30, with one set of Cutters or Chisels that will chamber from 75 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 7 Government Block, corner Sansome and Washington streets, and at No. 511 Market street. Address

HENRY M. STOW,
San Francisco.

Oil Wells! Oil Wells!!

I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ¾ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

GOLD DIGGING IN VIRGINIA.—A writer in the Richmond *Republic* gives the following concerning the Virginia gold mines: "Those who returned from the wars too late to put in crops are very busy washing gold from the branches and mines. I suppose there are two thousand miners at work getting gold in Goochland and Louisa counties; they average two pennyweights a day each miner. I have heard that they are working in Buckingham, Culpepper, Fluvanna and other counties. The gold mines have never been fully developed. The quartz veins are large and very rich, and would pay well. But not a single quartz mill is working in the gold districts. In a few places some are working with stone and iron mortars, and in that rude way doing very well. There will a brighter day dawn upon the mining interests of Virginia before fall."

Metallurgy.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business:

S. P. KIMBALL, J. R. MURPHY.

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices.

[Removed from Oregon street, between Front and Davis.]

SMELTING SILVER ORES.—It would appear from the following item which we clip from the Colorado *Mining Journal*, that a fire process for working silver ores has been successfully introduced into the Colorado mines :

Mr. Johnson called this afternoon with *five hundred ounces of pure silver*, taken by him from four and one half tons of ore, it being a part of that which remained from the first charge smelted at Lyon's Smelting Works. Other and grander results have been achieved, but which are not as yet allowed publication. The complete success of this experimental smelting of Colorado ores, some of them most refractory, is now established, and the millenium for which we have so eagerly looked has dawned upon our mines. May triumph attend all the efforts of Lyon & Johnson.

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m

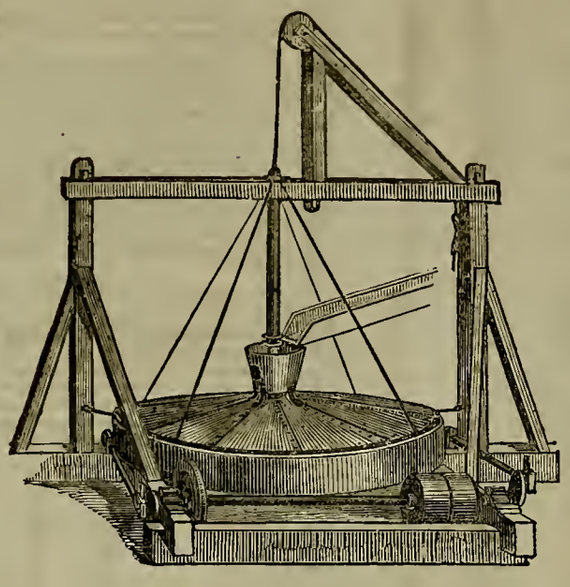
GOLD AND SILVER ORES.

UNDENIABLE FACTS FOR THE MINING PUBLIC.

At the Exhibition in the Fall of 1861, the Mechanics' Institute awarded a Premium to

E B. PRATER,

FOR THE BEST CONCENTRATOR.



The proprietors of this Concentrator feel satisfied that IT HAS NO EQUAL IN USE. Large numbers of these Machines are now in successful operation in all parts of this State, Arizona, Nevada, Colorado and Mexico. The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

One of these Concentrators can be seen in operation at Messrs. Kimble & Murphy's Metallurgical Works, Bryan street, between Third and Fourth, San Francisco.

Circulars sent free, giving description and reference as to working, etc., on application to

THE London *Building News* states that the large roof which covers the Imperial Riding School, Moscow, hitherto the largest in the world, is about to take its position as second on the list, as it is intended to cover the new Loudon terminus of the Midland Railway Company with a wrought iron roof of 240 feet clear span, being five feet wider than the Moscow roof.

AN invention is to be introduced in New York designed to make the starting of loaded street cars an easy matter for the horses. It is described as consisting of the application of a lever, pawl and racket, in combination with the draught rod, or its equivalent, to the axle of a vehicle in such a manner as to save over one-half the power now used in starting.

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,

Publishers Mining and Scientific Press.

Notice.—The Stockholders of the San Fernando Petroleum and Mining Company are requested to attend a meeting at the Office of the Company, on the first Monday in October, for the purpose of electing officers for the ensuing year.

A. N. CLARKE, Secretary.

ADJOURNMENT.—The above meeting was adjourned by a minority of the Stockholders, to the first Monday in November.

A. N. CLARKE, Secretary.

Office, 121 Montgomery street, San Francisco. oc7td

And in accordance with law and an order of the Board of Trustees, made on the 22d day of August, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 620 Montgomery street, San Francisco, Cal., on Thursday, the 12th day of October, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

EDWARD C. LOVELL, Secretary.

Office, 436 Jackson street, San Francisco, Cal. se23

United States Mining Company, Virginia District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of September, 1865, an assessment of 25 cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold or silver coin, to the Secretary, or to JAS. V. COFFEY, at Virginia.

Any stock upon which said assessment shall remain unpaid on Monday, the 14th day of October, 1865, will be advertise on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Sansome and Washington streets, San Francisco, Cal. se15

Walipi Gold and Silver Mining Company, Moss Lode, San Francisco Mining District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 12th day of September, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable on the 16th day of September, 1865, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. GONODON, Secretary.

Office, 520 Washington street (Room 5). se16

Wide West Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.
Assessment No. 4.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of September, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to F. L. JAOKSON, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, removed to 338 Montgomery street, San Francisco.

NOTICE.—At the above meeting Assessment No. 2 of 50 cents per share, levied August 22d, 1864, and assessment No. 3, levied March 18th, 1865, also for 50 cents per share, were rescinded, and stockholders having paid the same, or any portion thereof, will be credited on above Assessment No 4 accordingly.

se15 W. D. ROOT, Secretary.

Yosemite Silver Mining Company, Oro Fino District, Humboldt county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of September, 1865, an assessment of one dollar and twenty-five cents ($1.25) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to D. H. CROWE, No. 402 Front street (up stairs), San Francisco, or to JAS. T. MACLEAN, Superintendent, at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 6th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. O. PUTNAM, Secretary.

San Francisco, Sept. 20, 1865. se23

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

MEAT PIES WITHOUT VENT.—A correspondent of the *Lancet*, in commenting on the case of Mr. Sprague, who was charged with having poisoned his wife and her father and mother, at Ashburton, says: "All learned toxicologists and chemists appear to have forgotten the important fact that if a meat pie is made without a hole in the crust, to let out certain emanations from the meat, colic, vomiting, and other symptoms of slight poisoning will occur. I have known two instances of large parties being effected in this manner from eating pies that had no vent in them."

THE REBEL BALLOON.—The only balloon ever made by the rebels is on exhibition in New York. Two hundred silk dresses contributed by the ladies of Petersburg furnished the material for its construction. Professor Lowe secured the balloon and all its fixtures when the gunboat Teazer was captured.

"Patent Paper Reel for Telegraph Register."

SAN FRANCISCO, Sept. 18, 1865.

EDS. MINING AND SCIENTIFIC PRESS—*Sirs:*—Having noticed the above heading in your valuable paper of the 9th inst., I beg leave to inform you that the invention is not Mr. L. W. Worth's, but one already patented by me, while a resident of Cleveland, Ohio. His form of reel is one that I first got up in 1863, and filed a caveat for, and afterwards improved by putting some gearing, or clock machinery, so as not to use so much cord. The length of cord that I use now to run all day, would not run his reel one hour. After making my improvement, I applied for a patent, which was granted to me on the 19th of January, 1864. That patent covers all of his, so-called, improvement, as will be seen by my patent (No. 41,312) which claim reads as follows:

"What I claim for my improvement, is the arrangement of the mutually exchangeable reels D and F, in combination with the gears, cord, pulleys, and weight, the several parts being constructed, arranged, and operating as and for the purpose herein set forth."

This patent was obtained for me by Messrs. Brainard & Burridge, of Cleveland, Ohio, Patent Solicitors. And I further state, that all persons wishing to use said Paper Reels, will please to come and make arrangements with me for their use. As for any advantage he has over other reels, it can only be that he has a greater length of cord to wind up. Those that I built, of his style, before I had mine patented and after I filed a caveat, had all to be exchanged for my new Reel. In putting this up it takes only six screws to do the whole business, and takes up so little room that it is quite a convenient and useful instrument.

Address, **HENRY McGANN,**
12v1I At the Union Works, First st., San Francisco.

VALUABLE
PATENT RIGHT
FOR SALE.

The patent right for the United States of a valuable invention can be secured at a bargain by applying at this office. The article is one of general application throughout civilization.

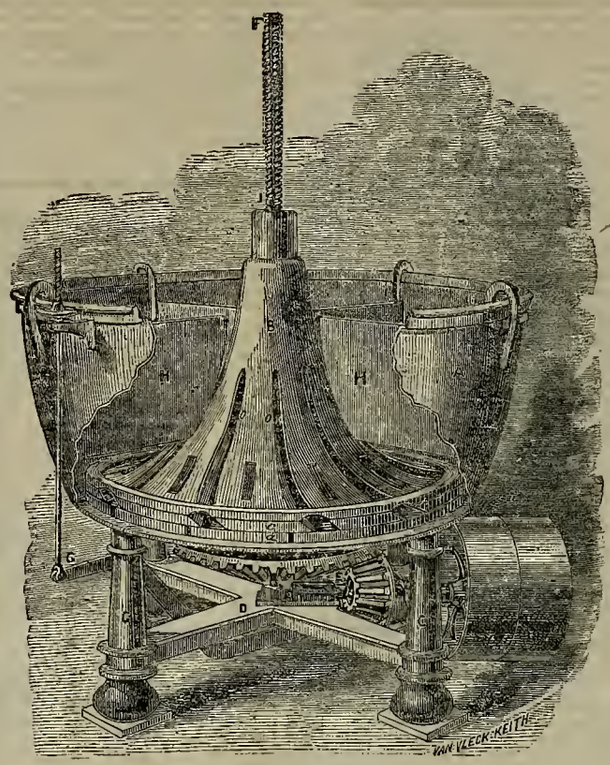
WILL CONTRACT FOR THE
PURCHASE OF COPPER ORES,
Assaying eight per cent. and upwards of Copper to the ton.
We will make advances upon Ores of Copper.
San Francisco, Post Office Box 1269, 22



THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

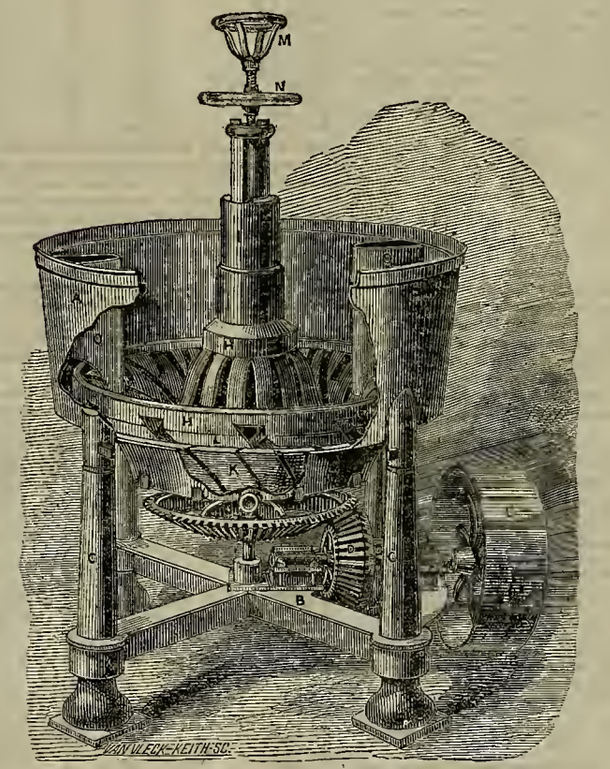
Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE
Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.
SAN FRANCISCO, June 13, 1865.



THE
WHEELER & RANDALL
Grinder and Amalgamator

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Pintes.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

THE CRICKET.—The Cricket is a curious little insect. It has given rise to two proverbial expressions; in France people say; "silly as a cricket," while in England and America we say, "merry as a cricket." Crickets eat grass, seeds and fruits, conveying them to their holes, and though they are very fond of drinking the dew on leaves and flowers, they are very careful not to wet themselves on their journeys in search of food. The young live in peace, but when they grow up they manifest a most bellicose disposition, and are continually fighting with one another. The boys in Germany are very fond of keeping crickets in boxes for the sake of their song, and for the purpose of watching their battles. What the game cock is to the Cuban, and the bull-dog to the Englishman, the cricket is to the German youth. Their contests are very sharp and very amusing. According to the way in which they happen to meet, they butt like rams, kick like horses, or scratch like cats, and the contest is unceasing in its ferocity, until one of the insects flees from the field or is disabled. It must be remembered that the European house cricket is not known in our country. Its song is much more varied and much cheerier than that of the species which sometimes finds its way into our hearths.

SALMON'S
PROPELLOR AMALGAMATOR
—AND—
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address
9v11 J. & W. C. SALMON.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to
JOHN MAILER,
Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco.
2v10

Machinery.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

Illustrated in the Mining and Scientific Press, April 9th, 1864.

HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Preliberg Amalgamating Barrel; all together forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,

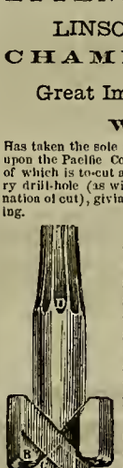
ATTENTION, MINERS!
LINSCOTT'S PATENT
CHAMBER DRILL.
Great Improving in Blasting.
W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.



D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ⅛ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, but one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

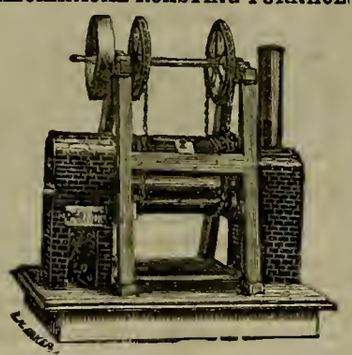
This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

The Mechanics' Institute
AWARDED A
PREMIUM SILVER MEDAL
TO BRUCKNER'S
MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders at the office of the MINING AND SCIENTIFIC PRESS.

W. BRUCKNER, Mining Engineer,
12v11 90t Kearney st, Room No. 12.

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

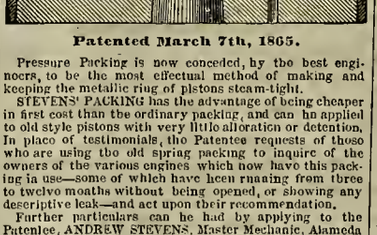
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

WATER WHEELS!
Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE,

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 50¾. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 50 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to
LEFFEL & MYERS.
At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11-1f

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer
and Amalgamator!

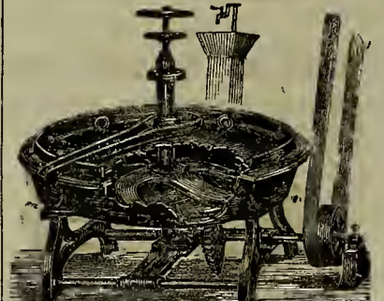
THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to
PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

M. DISNEY'S
Endless Chain Water Wheel

Gives the greatest power from the same amount of water of any wheel in use. Every pound of water used gives one pound power. It is cheap and easily constructed, and can be built anywhere, and may be so constructed as to give any amount of power according to the amount of water and the fall. It is now on exhibition at

521 Market street, in this City.

All are invited to call and see for themselves. We are ready to put in Wheels either on sluggish streams or under head. RIGHTS FOR SALE.

☞ This Wheel is peculiarly adapted to running streams, where parties cannot build dams so as to make use of the fall.

M. DISNEY, Inventor.
San Francisco, Sept. 6th, 1865. 11v10-4w

IMPROVED CAGE.—At the shaft being sunk by the Ophir and Mexican companies conjointly, they have put in a new cage, which not only has the safety apparatus and arrangement now in use at other shafts but has also a break so arranged that the cage can be stopped at pleasure at any point in the shaft and held there, even should ever so much slack cable come down upon it.

TWO PREMIUMS.—Mr. A. Hunter was awarded two silver medal premiums at the Mechanics' Fair—one for the best ore concentrator, and the other for the best grain separator.

Away with Spectacles.

Old Eyes made new, without SPECTACLES, DOCTOR, or MEDICINE. Pamphlet mailed free on receipt of ten cents. Address E. B. FOOTE, M. D., No. 1130 Broadway, New York.

AGENTS WANTED

—FOR—

The Secret Service, the Field, the Dungeon, and the Escape.

—BY—

ALBERT D. RICHARDSON,

N. Y. Tribune Correspondent.

1,000 COPIES SELLING PER DAY!

The most interesting and exciting book ever published, embracing Mr. Richardson's unparalleled experience for four years. Travelling through the South in the secret service of the "Tribune" at the outbreak of the war, with our armies and fleets, both East and West, during the first two years of the Rebellion; his thrilling capture; his confinement for twenty months in seven different rebel prisons; his escape, and almost miraculous journey by night of nearly 400 miles. It abounds in stirring events, and contain more of the fact, incident, and romance of the war, than any other work yet published. Horace Greeley says of it:

"A great many books will yet be written concerning this war, in addition to the many already in print; but not one of them will give, within a similar compass, a clearer, fuller, more readable account, entirely from personal observation, of the nature, animus, purposes, tendencies, and instrumentalities of the slaveholders' rebellion, than does the unpretending narrative of Mr. Richardson."

Teachers, ladies, energetic young men, and especially returned and disabled officers and soldiers, in want of profitable employment, will find it particularly adapted to their condition. Send for circulars. Address

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1853.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

THE EAGLE QUARTZ MINING COMPANY.

This company is located about three and a half miles southeasterly from Volcano, Amador county, and is now making preparations for a vigorous development of their mines. The property was originally located and for a long time worked by a large company of Mexicans, who erected some four or five small stamp mills and arastras, with which they took out fully $700,000 of free gold, chiefly from the surface of the mines. Like most other Mexican operations, this also gradually suffered from neglect and bad management, until the proprietors finally found themselves in debt, when the property soon passed out of their hands. It subsequently was held for short intervals by several other parties, and finally passed into the hands of the present proprietors—all San Francisco parties—who are now, as we have already stated, about to recommence operations in earnest. The mills were originally located upon the top of the high river bank, where the Mexicans did all their mining, never going down more than forty feet in any of the five leads of which the property consists. One of the late proprietors removed the principal mill down near the bed of the Mokelumne, where it now stands with two twelve-foot arastras, and from which point the company propose to tunnel into the veins, all of which, crossing the river pass directly into the hill, affording most favorable facilities for working to a great depth. The company owns 4,000 feet in each vein, and 750 acres of heavily timbered wood land adjoining. A tunnel has been started on the principal vein, which it struck in about eighty feet, and at a point where it is twelve inches thick; but which has widened to thirty-two inches in a distance of twenty feet. The rock looks remarkably well, shows considerable free gold and carries a large amount of sulpharets, which assay at the rate of $1,000 per ton, when concentrated. An assay was shown us with a button worth $2.02, which was taken from twenty-five pounds of the rock—$168 to the ton. This bids fair to become a very valuable property. It is located within twenty-four hours' travel of San Francisco.

Silver Medal.—Messrs. Knowles & Clark have been awarded a silver medal, special premium, by the Mechanics' Fair, for their new combination of gold and vulcanite dentistry, instead of a diploma, as was previously published.

Another Shock.—Another distinct earthquake shock was felt in this city about a quarter before one o'clock yesterday morning. It was quite as severe at Santa Clara as the one on Monday.

THE RECENT EARTHQUAKE.

The great sensation of the week has been the earthquake, which occurred at fifteen minutes before one on Sunday last, and which, by common consent, has been pronounced the most severe which has visited this coast for the last sixty years, at least. It was an occurrence which will long be remembered in the history of San Francisco and the State. However light men may speak of it now that it is past, and our beautiful city still stands triumphant over the convulsions of nature; certain it is that the terrible moment of panic which occurred when the final shock came to those who were pent up within walls of brick and stone, was an instant in which the bravest heart might well quail, and one which might reasonably be expected to unnerve the strongest man, and render him weak like a child. It has been our lot to experience some of the heaviest shocks felt in this city within the last fifteen years; and we remained quietly in our seat, (at church) during the first shock, which was quite a heavy one for San Francisco; but that man must have been either more or less than human, who could have remained stoically indifferent to the ruin and destruction which was threatened when the convulsion reached its crisis, and the heaviest walls swayed to and fro and trembled like an aspen, while others tottered and fell. Thousands of our population were in the churches at the moment—the most dangerous class of edifices in which we can be placed at such a time—but we hear of no unmanly act on the part of any of our citizens. The men of California are noted the world over for their bravery and presence of mind, when in sudden danger, in the presence of the opposite sex, as has repeatedly been noticed on board of our crowded and ill-fated steamers. This peculiar trait was especially noticeable on that occasion; and, forgetful of self, thousands of stout arms were raised in an attitude of protection or with the view to quiet alarm and restore confidence to those whose weaker nerves may excuse a yielding to sudden and overwhelming danger.

The daily press of the city has given with the most minute particularity the chief incidents of the occasion, and a full detail of the injuries which resulted to persons and property. It was certainly a most remarkable circumstance that no one was killed or seriously injured, from the numerous falling of fire walls, cornices, etc., which occurred in almost every part of the city. The limits at our disposal will not admit of any detail, in this connection, of the catastrophes which occurred; our remarks must necessarily be confined to a few generalities or such particulars as we have not come under the notice of our contemporaries.

As to the force and direction of the disturbance, we have abundant proof. Perhaps no better index of this can be cited than a circumstance which occurred in the southwest corner room of the third story of the old Exchange building opposite the post office. That room was occupied by two gentlemen of our acquaintance as a dormitory. A short time previous to the occurrence, a common wash tub, holding about five pails full, had been filled to the brim with water and left standing in the middle of the room. After the shock had passed, the fact was carefully noted that fully *two-thirds of the water had been thrown out of this tub*. The extent and violence of the vibration which could produce such a result may be readily appreciated. The opposite direction in which the water was evidently thrown, also afforded a very good index of the direction of the earth-wave, which nearly all observers agree in saying to have been from the northwest to the southeast. So violent and rapid was the vibration that a great number of chimneys were entirely broken from their supports, but mostly left standing in almost their natural position, a few only being thrown down, and a few more or less twisted apparently as by a circular movement.

The fact of an upward as well as forward wave-like motion, is proved by a fact which occurred during the lighter shock which was experienced about half past ten the next day, in the philosophical instrument shop of Mr. Roach, on Washington street, directly opposite the postoffice entrance. When that shock occurred, one of his workmen was sitting in a chair directly fronting a very large barometer, which was hanging against a brick wall, with his eye, at the instant, upon the mercury in the tube. While thus looking he saw the mercury suddenly drop about half an inch, and at the same instant perceived the tremor. This shock, it will be recollected, was a very slight one compared with the one on Sunday; yet the upward movement which depressed the barometer must have been several inches. In the same shop, on Sunday, a thermometer tube some eighteen inches in length, without a case, was hanging against a brick wall by the side of a barometer, the case of which stood out from the wall some three inches, but was so placed that it could not swing out as the tube might. The latteral movement of the wall, on Sunday, threw this tube out so that it swung over upon the face of the barometer hanging by its side, and lodged there, where it is still suffered to remain for the examination of the curious. Water was slopped out from several vessels, in this shop, similar to that from the tub in the Exchange Building already mentioned, and distant some 500 feet. This occurrence indicates a latteral movement of the wall of at least one foot! It occurred in the second story of the building.

At the time the shock occurred, one of the proprietors of this paper was standing upon a high mountainous elevation a short distance to the northward of Santa Cruz, some seventy miles south of this city. The first indication of the shock there was a loud rumbling noise, evidently from below the surface of the earth, and approaching the spot where he stood from the northward. The noise was accompanied with the usual vibration of the earth, immediately upon which there was an evident commotion among animate as well as inanimate nature. The cattle manifested their cognizance of the phenomenon by an evident consternation and unusual bellowing, while numerous flocks of quail suddenly rose from their hiding places and whizzed away in unmistakable fright. At the same instant a huge boulder, standing upon a neighboring height, a quarter of a mile distant, and weighing many tons, which had withstood the earthquake shocks of hundreds of years, and the numerous efforts of men who had vainly endeavored to dislodge it by levers, was loosed from its foundation by this extraordinary convulsion, and went crashing and thundering down the mountain side into the cañon below!

The shock of the earthquake was very distinctly felt in the harbor and outside of the Heads. The schooner Fayaway, on her trip from Monterey to this port, experienced a very sensible shock, from which the first thought was that she had struck a rock; the shock was heavy enough to jar the dishes on the table. The sea was perfectly smooth at the time, but a stiff breeze immediately sprung up, and in a few minutes they had a very rough sea. The experience of a vessel just outside the Heads was very similar to the Fayaway.

An officer of a vessel which lay at anchor in the harbor, states to us that his first notice of anything unusual was a rattling of the chain cable, as though it were dragging the anchor over rocks upon the bottom; the vessel was also sensibly agitated with a trembling motion, as from a violent agitation of the water. Almost immediately thereafter came a confused noise from the city front, and dust was also noticed to rise from several points which must have been produced from the falling walls. The calm that preceded the shock in the city was also here, as at sea, succeeded by a violent wind. We had intended to have followed the example of our cotemporaries and philosophize a little upon the subject of *seismology*, a term by which the discussion of facts connected with earthquakes is known; but the space which we have already occupied upon this subject, induces us to defer such discussion until another week.

Treasure Receipts.—We would call especial attention to the Associated Brokers' Stock Circular, of the present week, which will be found in another column. It contains the usual quarterly report, recapitulating the treasure receipts for the first three quarters of the present year. It is a gratifying fact that our treasure yield has been gradually and regularly increasing for the past four years. The recorded receipts of treasure from the mines for the past year to date has been $41,640,420, which, by adding the usual ten per cent. for private hands, will be increased to $45,804,562, a gain of $2,594,455, over the same period last year.

Planting Chesnuts.—We notice in an Ohio journal, a communication from Dr. Kirtland, in relation to the cultivation of chestnuts. He raised in his garden, from seed, the French, Spanish, and Italian chestnuts, some twenty years ago, which he transplanted, and which, when ten years old, commenced bearing crops. He thinks they will pay well to cultivate, and also recommends the shellbark hickory nut for cultivation. He says the three kinds of chesnute named are about equal in size.

The chestnut has been spoken of as a tree well suited to California. We see no reason why the chestnut and hickory might not be made to thrive here and return a rich reward to the planter. They would, doubtless, both produce fruit much sooner here than in the Atlantic States, as all other trees which have hitherto been tried here are found to do.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Electricity—Its Relation to Matter---Ocean Telegraphy.

It has recently been discovered that the periodicity of the solar spots is identical in duration with a certain variation observed in the intensity of terrestrial magnetism—that the intensity of terrestrial magnetism varies with the amount of heat received from the sun. While considering this fact, some three years since, the idea suggested itself to the mind of the writer that electricity might be a property of matter; that it might exist in two conditions, free and latent, and as with heat, the density of matter might also be the measure of its capacity for electricity. This proposition, upon reflection, seemed perfectly in accordance with every fact with which I was acquainted. It appeared like truth, which, when once found, no matter from what stand-point it may be viewed or approached, is truth forever. The more I investigated this subject, the more evident this truth appeared, and the more perfectly was my mind enabled to perceive the true relation of electricity to matter.

"Hypotheses, well conceived and properly conditioned by strict analogy," says Professor Joseph Henry, "not only enable us to embrace at one view a wider range of phenomena, but also assist us to pass from the known to the unknown. When rightly used, they are the great instruments of discovery, giving definite direction as to the experiments or observations desirable in a particular investigation, and thus marking out the line of research to be pursued in our endeavors to enlarge the bounds of the science of our day."

In order that the relation of electricity to matter may be more clearly expressed, the following series of postulates are proposed:

1st. Electricity is a property or quality of matter.

2d. Electricity exists in two conditions—namely, as free electricity and as latent electricity.

3d. The density of matter is the measure of its capacity for electricity.

4th. Every variation in the density of matter is attended by electrical disturbance, and as heat is a modifier of the density of matter, it may be considered the principal disturber of the electrical equilibrium.

5th. When a body of matter is expanded by the absorption of heat, a definite proportion of free electricity is rendered latent, and when the body of matter contracts by loss of heat, it is again set free.

6th. Heat, on being liberated by the contraction of matter, tends to radiate freely into space; while electricity, on being set free, is attracted by matter with a force varying inversely as the square of the distance—that is, when the distances are 1, 2, 3, 4, 5, etc., the forces are 1, 1-4, 1-9, 1-16, 1-25, etc.

7th. The electricity tends to equal diffusion over bodies with which it may be in contact, and to remain at rest, and it only moves in obedience to some disturbing influence.

8th. "Electricity can move freely in certain bodies, such as metals, water, etc., which are hence called conductors; and cannot move, or but imperfectly, through other bodies, such as glass, baked wood, dry air, etc., which are called non-conductors."

It may be stated as a general truth that the earth is perfectly electrical; that it is a great reservoir of free electricity, as is shown by the operations of the telegraph. The earth, as a whole, is found to be a good conductor, and its electrical tension cannot differ much in different parts. We are acquainted with no chemical, thermal, or mechanical action, in our own era, sufficient to produce this constant electrical state. The size of all bodies is determined by the amount of latent heat and electricity they contain, and their density is the measure of their capacity for these imponderable properties. All liquid, and many solid bodies, are converted into vapor by heat and the natural supply of electricity. However refractory a body may be, it is immediately converted into invisible gas by the expansive energy of heat, and an increased flow of electricity. Rowel and Spencer made an experiment, which showed that when a full supply of electricity is cut off by insulation, the evaporation was retarded. For this purpose they put the same weight of water into two vessels, one of which was insulated, and the other connected to the ground by conductors of electricity, and they found the latter always lost most by evaporation; thus showing that an increased quantity of electricity is essential in the formation of vapor, which must be latent, so that the attractions and repulsions balance each other; otherwise vapor would not ascend from the earth. For it must be remembered that matter attracts electricity, and is also attracted by electricity, with a force varying inversely as the square of the distance.

The earth is known to be constantly receiving electricity from the atmosphere, and it is evident that were this supply not constantly renewed, the atmosphere would soon be deprived of its free electricity, in consequence of the superior attraction of the earth. Whence comes this redundant electricity with which the atmosphere is found to be habitually charged? That atmospherical electricity is due to the condensation of vapor is beautifully exemplified in the workings of nature. Thus, when two opposing currents of warm air loaded with vapor rush upwards into the colder regions of the atmosphere, condensation rapidly ensues, the latent electricity of the vapor is set free, the cloud becomes charged, until its attraction for free electricity is overcome by the superior attraction of the earth, when the vivid lightnings appear, and we have all the phenomena of the thunder shower. Again, the warm, dry air that constantly floats over towards the polar regions, is condensed by the intense cold of the arctics; and its latent electricity on being set free, owing to dry air being so perfect a non-conductor, becomes apparent in the flashings of the magnificent Aurora Polaris. If we admit that heat is the principal disturber of the electrical equilibrium, then currents of electricity should pass from the colder to the warmer portions of the earth, or from those places where condensation is the most rapid, to those places where expansion and evaporation go on with the greatest activity. Electricity liberated during the cold of the night would be absorbed during the heat of the day, and as the apparent motion of the sun is equatorial, the direction of the electrical currents should also be equatorial.

It has been demonstrated by experiment that the needle of the compass will stand at right angles to a passing current of electricity, hence the polarity of the needle—its position as to variation from the true north showing the direction of the electrical current in different localities. The currents of warm air and warm water that are continually floating over towards the poles, together with the Gulf-stream, to which the peculiar disposition of land composing the shores of the Atlantic and Arctic oceans gives direction, as it flows along the coast of Norway and Siberia, takes a turn around the great cooling basin of the Arctic, and flows back into the Atlantic laden with icebergs, would have a tendency, owing to the incidental climatic effects, to intensify the earth currents of electricity in the Northern Atlantic. And then during the late autumn, winter, and early spring of the year, the coasts of Ireland and Newfoundland differ greatly in temperature. If we admit that variation in the density of matter by the absorption of heat or by the loss of it is attended by the disturbance of the electrical equilibrium, then here, most certainly, we have the conditions for greatly intensified electrical action.

Taking this view of the subject, is it a thing to excite surprise, that insulation should be lost, in attempting to telegraph across the Atlantic, with a single wire, where such strong counter electrical currents are likely to exist? Would it not be wisdom, instead of trying to overcome the strong counter currents, by increasing the size and conducting capacity of one wire, to lay two insulated wires, and complete the circuit with wire, and thus seek to be independent of all outside electrical disturbances?

When this is done, telegraphing across the Atlantic or any other ocean will be a complete success. The wire will always be under the control of the operator, for the current of electricity employed will have no resistance to overcome, save that offered by the metal used as a conducting medium. And then a wire, as much less in size and conducting capacity than the old Atlantic cable as can be successfully laid, will be large enough for all practical purposes.

During the process of telegraphing with one wire, the earth being a vast reservoir of free electricity, a certain amount of the electric fluid is taken up at one point and deposited at another, the circuit being effected by displacement, thus showing the perfect mobility of free electricity, how easily the electrical equilibrium is disturbed, and also that the earth is a good conductor. Electricians have erred in supposing that because the earth answered so well to return the electrical current for a few hundred miles, it could be depended upon as a conductor across wide oceans. Even between New York and San Francisco it is found to be expedient to repeat messages three times, and across dry land at that, where it cannot be supposed a great amount of electrical disturbance should exist. It is, or soon will be, a necessity of the times that there should be perfect telegraphic communications betwixt New York and San Francisco. This will be impossible, without perfect insulation, which cannot be obtained unless the circuit is completed with insulated wire.

How may it be accounted for that the earth is permanently electrical, or in other words, that it is a reservoir of free electricity?

In attempting to answer this question, I shall introduce a synopsis of an argument used by the writer, in a discussion of the formation of "metalic veins," with the late E. A. Miles, under the title of "Are metal-bearing veins of igneous origin?" In considering this question, the writer will first attempt to show that the solid earth is the product of the ignition and combination of the elements of which it is composed. "In the beginning God created the heavens and the earth; and the earth was without form and void. And darkness was upon the face of the deep; and the Spirit of God moved upon the face of the waters, and God said let there be light, and there was light." To-day the earth exists as a vast body of solid matter, yet in the beginning the great Author of all things assures us it was without form and void—the matter composing the bodies belonging to our universe was in its elementary or gaseous state. It is a most significant fact that all bodies may be expanded into invisible gas through the agency of its imponderable properties—light, heat, and electricity. When all matter existed in its elementary or gaseous state, darkness was upon the face of the deep, and all the light and heat that has radiated into space from the beginning, was then latent, in combination with matter. Electricity, being a property of matter, was also latent; yet, unlike heat which radiates freely into space, it is attracted by matter, with a force varying inversely as the square of the distance. The absorption of the exact amount of caloric and electricity that has been liberated from the beginning by the matter of which our earth is composed, would again render it gaseous. The earth is found to be composed of something over sixty elements, which, in the beginning, the Creator declares were without form and void, and according to known laws, these gasses were mechanically mixed and equally diffused through space.

When the elements combined to form solid bodies, would the evolution of light and heat be the result? In considering this question I shall arrange and present facts familiar to every student of chemistry. Oxygen combines with all the other known elements, except, perhaps, fluorine. All of the metals have strong affinity for oxygen with which they combine, with the evolution of intense light and heat. The experiments of Bunsen and Kirchoff in spectrum analysis, show that metals must be expanded into vapor by the absorption of heat and electricity before they will combine with oxygen to produce light. If we admit the declaration of the Creator, that in the beginning the earth was without form and void, or in other words, that all the elements were gaseous, then we must perceive that the elements were in just the condition to combine with the evolution of light and heat to form solid bodies. Hydrogen and oxygen, when mixed together, take fire on the approach of a flame, or when a spark of electricity is passed through it, and explode violently, and water is the only result; and without water the operations of the chemist would cease. Light causes hydrogen and chlorine to combine with violent explosions, forming hydrochloric acid. Electricity is a property of matter, and as the density of matter is the measure of its capacity for caloric, so also the density of matter is the measure of its capacity for electricity. A given quantity of water, on being expanded into vapor, has power to render a definite proportion of electricity latent, which is again set free on the vapor being condensed into water. Free electricity is attracted by matter with a force varying inversely as the square of the distance, and it diffuses over it with the rapidity of light.

Now suppose there exists in space, held in its proper orbit by the laws of gravitation, a vast body of nebulous matter, composed of the same elements in a gaseous state mechanically mixed, and in the same proportion as they are found to exist in our earth. In consequence of the intense cold of surrounding space, condensation would ensue and sparks of liberated electricity would pass between bodies of the aggregating mass, unequally charged, as from cloud to cloud. The process of chemical combination would instantly commence, waters would be produced, atoms of potassium being in contact with water would ignite and burn with a continued flame; the other alkaline metals would take fire as they combined with oxygen, the temperature of the mass would increase as the elements united, and the result would be a self-luminous body like the sun, with its atmosphere of burning metals. Thus, a fire started by a single spark of electricity, would not cease to burn until the elements combined in every proportion and form that an elevated temperature will produce. If we admit that the imponderable properties of matter determine the size of all bodies, it is easy to understand how the earth should, in the process of the condensation of the matter, of which it is composed, from the gaseous or elementary state to a solid body, become a vast reservoir of free electricity.

While advancing the foregoing hypothesis of the relation of electricity to matter, I have aimed to present my conceptions of truth in a direct and pointed manner, and believing it to be perfectly in accordance with facts, I ask of the reader such attention and thought as the subject merits, that he may satisfy his own mind whether or not these things be so.

On adopting these views it occurred to my mind, some three years since, that if this theory is really truth, I ought to be able to make some new application of electricity, or discover some mistake that had been made in attempting to apply it. On reflecting upon the cause of the failure of the first Atlantic cable, I predicted the failure of the second attempt in the following terms:

Trans-Atlantic telegraphing can never be conducted with satisfactory results, without the employment of two insulated wires of uniform size and density. By using an insulated wire for the returning current, ocean telegraphing may be performed at all times with perfect regularity and certainty. The electrical disturbance existing in the Atlantic might be overcome by repeating, but this method of telegraphing, however, is impracticable across wide oceans. In telegraphing with one wire, the circuit is effected by displacement, and as the distance increases the force of the returning current decreases until it would finally be lost; especially if between the terminii sought to be connected by the telegraph there should exist any considerable counter disturbance of the electrical equilibrium. In relating the experience of the late expedition, it is stated that "the only discouragement apparent is the inability of the electricians to discover any serious fault in a cable before it is paid over the ship's side." There can be no good reason why the insulation of a well constructed cable, carefully paid out, should not remain perfect. The real difficulty is, that the earth cannot be depended upon, as a conductor, to complete the circuit. Let two well constructed cables be carefully laid, and the circuit thus be completed with insulated wire, and the trans-Atlantic telegraph will be a success. F. A. H.

[Written for the Mining and Scientific Press.]

The Washoe Consolidated Company---Truckee Meadows.

Editors Mining and Scientific Press:—It may not be uninteresting to hear from the so-called Sage Brush country of the State of Nevada, where I have recently been on a visit to the different mining districts. My attention was particularly called to the country around the Truckee River. Four years ago not a single house could be seen along this river as far as the eye could reach; but now we find most of the Sage Brush land taken up, a large amount of it fenced in, and houses built all over the valley bordering upon the Truckee River. The waters of the Truckee, which then flowed undisturbed, are now turned from their original bed and used for milling and irrigating purposes. Among the greatest undertakings in the way of converting a wilderness into a producing and civilized country, is the works of the Washoe Consolidated company of which I will give you a short description.

These extensive and valuable works were formerly the property of Col. W. O'Conner, who was the original founder of this concern, which is now owned by the above named company. The stock is mostly held in London; Col. O'Conner is the managing director, and he deserves great credit for the extensive undertaking in making this former wilderness what it now is.

The company carries the water of the river in a canal about four miles to their mill, by which they get a fall of thirty-eight feet, and it is intended to carry the water six miles further to irrigate about 20,000 acres of land. The first use of the water is to drive a quartz mill, and other machinery, in their reduction works, by means of an overshot wheel twenty-eight feet in diameter and eighteen feet breast, calculated to be 100-horse power. The wheel is well built and balanced. A splendid 20-stamp

hattery, made at the Miners' Foundry in San Francisco, has been erected, the wood-work of which is the strongest of any I have ever seen. The amalgamating capacity consists of twelve of Wheeler's amalgamators and settlers. After leaving these, the tailings will be passed over concentrators of my own patterns, by which both the quicksilver and sulphurets will be saved in the most economical manner. The company is also building large roasting furnaces, and it is the intention of the Colonel to render this establishment the best reduction works in the State of Nevada. The company also owns several mines in the neighborhood, which are as yet only partially worked. The outcroppings in one of their mines about half a mile from the works, show several lodes, and indicate that large deposits of ore may be met with. From the nature of the ground I should judge that they will have to sink from 350 to 500 feet before the mine will yield any rich ore. The croppings are several hundred feet in extent, and assay from five to twenty-five ounces of silver per ton, and some gold. The mining ground is easily worked and perfectly dry, so that the work is not expensive. Besides this, the company owns about 1,200 acres of land of the best quality in the valley, all of which can be irrigated by the canal above named. The experiments tried here this year show that this land is capable of producing an abundance of wheat, corn, barley, potatoes, and other vegetables. A town has also been laid out, called Auburn, and several houses have already been built. Within another year it is the intention to make this property not only one of the handsomest, but also one of the most profitable in Nevada, and I trust that Col. O'Conner will be rewarded with all the success he deserves, for his energy and perseverance in making this as the only English company in Washee, a successful concern.

J. Mosheimer.

Truckee Meadows, September, 1865.

The Chemistry of Silver Veins.

Dr. Blatchly, of Austin, Reese River, has recently made an interesting report on a series of veins in or near the Yankee Blade district a portion of which will be read with interest, as explaining the peculiarities of the veins in that rich section of the Reese River mineral region. The claims embraced in this report are the New York Central, Purdy, Kearsarge and Metropolis. We copy from the *Reveille*:

These four veins present all the peculiarities of the most renowned ledges in the districts—as the Midas, Romeo, and the General Sigel, which did not show much ore on the surface, but as they were followed down proved to be quite valuable. It is probable that all the silver in these veins exi ted at one time in the form of a sulphuret, and that this ore was formed under water. By the operation of internal forces, these veins were thrown above the water, and exposed to the action of the atmosphere, which decomposed the sulphuret of silver, forming sulphuric acid, and leaving the silver free. This acid reacted on the silver and formed a sulphate of silver, which is soluble in water. The water from the surface, filtering through the veins slowly but surely, washed the silver away, and left the vein barren. We find many veins nearly barren on the surface, but rich below the water level, as the ores below were covered by water, and protected from the action of the oxygen. These chemical changes are seldom or never completed, and hence we rarely find a vein which is entirely barren on the surface, rich beneath. But, still, a large number of the veins that are richest below the water level, exhibit only traces of silver on the surface. If chlorine were present, it would decompose the sulphate of silver, and form chloride of silver, which is not soluble in water, but would remain fixed in the vein. These changes, which Nature works in her secret laboratory, in the course of ages, under a low temperature, are effected in a few hours in a reverberatory furnace. The same elements produce similar changes in either case. The causes cited seem to afford a sufficient reason for the fact, that all the veins in this district require to be opened below the water level before they exhibit rich ore or permanent characteristics. The veins under consideration will not prove exceptions to this general rule.

Rattlesnake Quartz Mining Company.—We have received a copy of the by-laws, etc., of the Rattlesnake Quartz Mining Company. This company was incorporated in September last, for the purpose of mining on certain quartz veins known as the Mississippi, Trinidad and Fairview veins, situated in Big Oak Flat District, Tuolumee county. The capital stock of the company is $27,000, divided into 4,650 shares of six dollars each. The principal place of business of the corporation is in the town of Alameda, Alameda county. Thomas A. Smith and Joel Ray of Alameda, and Joseph C. Boyd of San Francisco, are the corporate trustees.

Mechanical.

THE FOUNDRIES.

Owing to the lateness of the season, and the prospect of difficult and expensive transportation during the winter months, the *heavy* orders for mining machinery are not so numerous as in the early summer; but the demand for shoes and dies, and the lighter articles of machinery for the winter supply, is unusually active. Some small mills have also been ordered, which are to be finished and shipped to their destination before the winter sets in. Among these may be mentioned a 10-stamp mill for Mr. S. Reynolds, of Clear Creek, Tulare county, shipped by Goddard & Co. of the Pacific Iron Works, on Wednesday last, this being the fifth mill shipped to that locality by this establishment within the last few months. Messrs. G. & Co. are also manufacturing a number of Varney's amalgamators, for parties in Humboldt, Nevada, and the machinery for a large flouring mill for the Rogue River valley, in Oregon, in addition to which they have an unusually large amount of jobbing work on hand.

At the Miners' Foundry, the monster sugar mill for the Sandwich Islands, noticed some time since, continues to be the principal feature. The copper work for this mill is being made by Mr. James Macken, on Fremont street, and is of the best quality, to correspond with the iron work now in construction at the "Miners'." Like all the others, this establishment has an immense amount of miscellaneous work on hand, including all kinds of mining, mill, and oil-well boring machinery, among which last we noticed a very beautiful horizontal engine, with cylinder 6x14 inches, intended for the Southern coast, which was almost ready for shipment.

The Golden State Iron Works, though they have turned out nothing very striking, within the last few weeks have been working to their full capacity, having melted over 200,000 lbs. of iron within a month's time, and have exceeded in this department some of their neighbors whose capacity for work is more than double their own.

Direct-Acting Pumping Engines and Direct-Acting Winding Engines.

At a meeting of the North of England Institute of Mining Engineers, assembled in session, by invitation, with the South Lancashire and Cheshire Coal Association, also an association of mining engineers, recently held at Manchester, England, much interesting discussion was had, and several very valuable papers were read, having a bearing upon the mining interests of Great Britain, and the world, as well. The nature of the papers read, and the facilities which have been afforded to the members of these associations for obtaining information, have been such, as, in the estimation of the British public, to render that meeting one of the most important of the kind which has taken place for a great number of years, and the information disseminated by it as most fully reliable, combining as it does the united experience and wisdom of the two most intelligent engineering associations on the globe. Among the papers read, was one by Mr. John Knowles, "On Direct-Acting Pumping Engines and Direct-Acting Winding Engines;" which is of especial practical interest at this time on the Pacific coast. The enormous cost attendant upon the class of pumping engines which are required to draw the deep mines that are now being opened on this coast, for gold, silver and coal, renders of the utmost practical importance to all, any information calculated to reduce this heavy portion of the expense of deep mining. The long experience and the close habits of observation, with the view of economizing power and expense, which characterizes the leading mining engineer associations of Great Britain, would seem to assure us that there is no other source than those to which we can look with greater degree of confidence for the information we desire in this direction. With this view we append the substance of Mr. Knowles' paper, as given in the London *Mining Journal*:

As the pumping engine had greater and earlier attention paid to it, in consequence of the enormous expense that some collieries had been subjected to, on account of the large quantities of water raised, it was, perhaps, desirable to state the improvements made with respect to it. In doing this he (Mr. Knowles) would take the engine at the colliery near Littleborough, as a sample of this kind of engine. It was a direct-acting engine, with a cylinder 57 inches diameter, and a 10 feet stroke. It was placed over the pit, and used to pump the water during the sinking of the shaft. The steam was used on the underside of the piston, at a pressure of 40 lbs. per square inch, and was cut off at a part of the stroke, and when the up-stroke was completed, the steam was allowed to go through a regulating valve to the top side, and make the down stroke, which was then ready for condensing for the next up-stroke. The engine had a beam, with a small balance to counteract the weight of the draw-lift rods. The top set of pumps were 80 yards long, with a ram 20 inches in diameter, and the rods were so arranged that their weight would force up the water to the top of the pit. The lower set of pumps had a bucket-lift, 18 inches in diameter and 46 yards long, and these rods were balanced by the weights on the engine-beam. When the pit was sunk 80 yards, the 20-inch ram-pump was put in, and connected directly with the top rod, and the lower draw lift was put to it in the usual manner. During the sinking of the pit, which was an oval one, there was a feeder of 600 gallons of water per minute to contend with it, and when the engine stopped it rose up the pit 1 foot per minute, and when the clacks had required changing, the change had to be made in 15 minutes. Connected with this engine there was an arrangement by which the handles opening the valves could be so arranged that they would open at any speed, and cause the engine either to work fast or slow at the up-stroke or down-stroke, or, if requisite, remain stationary a short time. There was also a registering indicator, so arranged that every stroke or part of a stroke was counted, which had been at work since the engine started, and it was possible to ascertain the number of strokes it had made since its erection. The first of these indicators was used in 1851, at the Bell Field pumping-engine, and was found so useful that they had since been adopted at all the pumping-engines owned by Messrs. Knowles. One of the advantages of the engine was that there was very little friction between the power exerted upon the piston and the work of raising the rods and water, and of necessity, must use less fuel. Another advantage was that it obviated the risk and chance of such an accident as that which occurred at the Hartley Colliery, as the beam which was used as a balance was kept in such a position that it was almost impossible for it to fall down the shaft.

The first direct-acting pumping engine erected by the late Mr. Andrew Knowles, of Eagley, was at the Eccleston Colliery, near St. Helens, in 1829, when there were many difficulties to contend with, not only on account of the engine, but also as this was the first place where the ram-pump was tried. Since then a great number had been erected, and no doubt the idea of the steam-hammer and the steam pile-driving machines was taken from these. Mr. Knowles had taken the engine at the Clifton Hall Colliery as a sample of the direct-acting winding engine in Lancashire, on account of its being the largest erected by Messrs. Knowles, and having a compensating drum. It was also used for winding water, which gave the opportunity of testing its economical value. The cylinder was 42 in. in diameter, and had a 6-feet stroke; the pressure of steam 45 lbs. per inch. The connecting rod was 18 ft. long, and shaft 14 in. square, and of wrought iron. The compensation drum commenced at 15 ft., and ended at 25 ft. diam. The ropes lapped on the drum from each outside, and their tendency in ascending was to lie against the side of the drum, and avoid slipping off. The outside of the drum was made of English oak, and the grooves were cut into it, iron-plate guards being on some parts of the scroll. A steam brake was used at this engine, and was under the command of the engineer, who could throw on the steam at any moment; and it was so powerful that it would stop the main engine in less than two strokes if it was going at full speed, with all steam on; but if the steam was off it would stop it instantly. The engineer used the brake in his ordinary work, so that it had always to be kept in order, and, therefore, ready for any emergency. The pulleys over the pit were 3 ft. 6 in. from each other, and were 15 ft. diameter, with wrought-iron arms, and the outside rim was arranged to be filled up with timber, so that the rope would not be so much injured. At present the engine had not full work, and the average amount of coal raised was 280 tons per day, from a pit 427 yards deep. The pit was 9 feet diameter for 220 yards, and 10 feet diameter for the remaining depth, and had two ropes in it. The cargoes had two decks, with two wagons of coal, containing 7 cwts. each, on each deck, making 28 cwts. of coal raised at one lift, and it was raised 13 ft. 6 in. in 45 seconds, or at the rate of nearly 20 miles per hour. The greatest speed of the cage when in the middle of the pit was 25 miles per hour. There was also a lowering platform used, which was a great advantage.

The experiments showed that 106,975 gallons could be raised 100 yards by the consumption of one ton of slack, proving that the system was much better than using beam-engines, wheels, and L-legs, but not so economical as the direct acting pumping-engine. In deciding upon this important matter many considerations must be weighed. If the quantity of water to be raised was but small and at a great depth, with sufficient lodge room for a week, then this plan would perhaps be the best—one of the considerations being the great expense of erecting a pumping-engine for a small quantity, when the winding-engine could easily do the work. If the quantity of water was large, even at any depth, the direct-acting pumping engine would be found to be the most economical in the end, and it was certain to be so with a moderate depth.

Mr. Greenwell asked whether he had rightly understood Mr. Knowles that the apparatus could not be stopped till two strokes of the engine had been made? That would be something like 24 fathoms.

Mr. Knowles had only wished to show the great power of brake which could stop the engine, although it was at full speed, but the steam could be taken off, and the brake applied simultaneously. * * * *

Mr. Dickinson thought it very important that so many practical questions should be suggested before the discussion was adjourned; for, if there was one thing more than another in which the Institution might expect to find excellence in this district it was machinery. It would bear comparison with any he had seen elsewhere in this county or out of it. Mr. John Knowles, being connected with a firm which had so many collieries at work in the district, had had so many opportunities of comparison, that he thought that gentleman's paper would be sufficient to establish the superiority of direct-acting engines over those which were indirect. But, although that was the result of his experience, and it would probably be adopted in this county from that date, there were parts of the county where at present direct-acting engines were not used. For instance, in one colliery district the opinion prevailed that the intervention of wheels, so as to make a difference between the velocity of the pump-rods in the pit and the velocity of the piston in the cylinder, was advantageous, and more than counterbalanced the friction inherent in indirect-acting engines. In Cornwall, also, from whence, perhaps, they had the best pumping engines, the old view was that the stroke of the pump-rods should not be the same as the stroke of the cylinder, and for many years he believed all the Cornish engines were made with a difference of about a foot between the two strokes. But latterly, in Cornwall, he had found new engines made with the two strokes equal, so that the theoretical difference was disappearing, and that little balance against the friction would have to be taken off

Molasses from Maize.—The firm of Berthold & Thompson, of St. Louis, assisted by a French chemist named Delmie, are manufacturing molasses from Indian corn by a new process, with imported machinery. The St. Louis *Democrat* of the 10th inst., says the quality is not inferior to that extracted from the best cane, not liable to fermentation, and of good flavor, body, color, and saccharine properties. The *Democrat* speaks of the cheap rate at which this article can be furnished, and adds

From one bushel of grain three gallons of molasses can be extracted at least. The market value, therefore, of the corn staple of our own fields will decide the quotations of molasses, and preclude the possibility of these prime necessaries from presenting, as has often been the case, a wide difference in prices. Indeed, the farmer is thus made the recipient of the additional advantage and profit of raising his own saccharine, and saved the trouble and expense of making an exchange of products through commercial channels for the purpose.

The New Overland Telegraph.—Work has been commenced on the new Overland Telegraph between this place and Austin, says the Virginia *Enterprise*. The line will extend from Chicago to San Francisco. The eastern end of it is already built and working to near Denver, and work has been done between here and San Francisco. Before many months elapse we shall have two lines of telegraphic wire across the plains.

Amount of sales.....$232,140 00

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board

SAN FRANCISCO, SATURDAY MORNING, October 14th, 1865.

The money market this week has exhibited rather more activity, hnt the requirement as yet is not of sufficient urgency to effect the current rates of interest upon first-class paper and other collateral. In stock circles some stringeney has beeu felt, and the reeent decline in nearly all shares has, for the moment, impaired confidence to such a degree that aecommodations are now obtained with much diffieulty upon this description of security. It is contended, however, that a partial withdrawal of the usunl facilities extended to a number of stock dealers has been the oecasion of the present panie, and that ns soon as the market assumes a little more shape and eonsistency, and certain weak holders have been compelled to realize, capitalists may he expected to exhibit their former confidence in stock collateral loans.

Receipts of Treasure from domestie sources, since Saturday last, amounted to $1,250,000, making an aggregate of $2 150,000 thus far during the current month. The supply of Bullion is likely to he ample for Tuesday's steamer, and gold bars are selling at 840@850. Silver is unchanged, and is quotable at par @ ½ ℗ cent. premium, for average lots.

The arrivals of Treasure in this city, from all sources, during the first nine months of the current year, have been as follows:

From California	$24,029,743
From Nevada	12,404,776
From Victoria and Portland	5,213,901
Imports, foreign	1,300,000
Total	$42,948,420

The above figures include coin as well as hullion. The total recorded receipts of the latter for the past nine months, amounted to $37,984,031, showing an inerease of $2,594,455, as compared with a corresponding period of last year. The receipts from Nevada (nearly all of which were hullion), during a like period in 1864, were about $11,000,000, showing an increase this year of $1,404,000.

The product of all the mines on this coast, received through regular channels and in private hands, from Janunry 1st to September 30th, has prohably reached $45,000,000. The exports of treasnre from this port during the same period amounted to $33,111,365, ns against $43,772,559 in the first nine months of last year.

Since our last issue, the Mining Share Market has been exceedingly nctive, and nearly every stock on the list met with a serious decline. The panic still prevails, and is attributable solely to the sale of a large amount of hypotheeated stock to cover advances. The severity and suddenness of the fall in prices seems to hewilder most operators, and until this feeling subsides, and a little reflection is given to the real character of the different mines, it is reasonahle to anticipate great caution and eveu timidity on the part of those who are disposed to invest in them. A reaction may, however, take place at any moment.

Alpha declined from $1,800 to $1,500, rallied to $1,600, and closed at $1,400, at which rates 38 feet in all were sold. There is no unfavor, ahle change to note in the condition of this mine, and the financial affairs of the eompany are steadily improving.

Yellow Jacket was dealt in to the extent of 130 feet, dropping from $1,200 to $1,060, rallying to $1,115, receding to $1,050, then selling s $1,080, buyer 30, and closing at $1,080. During the week endnig Octobe 2d, 30 tons first-class and 1,266 tons second-class ore were extracte from the mine, and 46 tons first-class and 1,517 tons second-class ore were reduced, yielding an aggregate of $67,545.22. The entire in debtedness of the company, at the close of last month, amounted t $295,359.51. This includes $30,000 due in Octoher, November January, and March next, on aecount of a reeent purchase of ms chinery, and $132,000 maturing in April and July, 1866, in paymen of the Morgan Mill, so that the floating deht now is less thar $134,000. The extraordinary expenses last month exceeding $45,000 mainly for improvements in the South Shaft, and to the Morgan Mill

Savage fell from $1,100 to $990, and $1,000, hnyer 30, then sold at $1,010, and closed nt $1,015. The drift in the lower level now shows different qualities of ore a distance of 60 feet across the lode, and other portions of the mine are said to look well.

Gould & Curry declined from $1,160 to $970, and was held yesterday at $1,100. Three outside mills are now employed in addition to the company's establishment, with a reduction capaeity in all of some 135 tons of ore per day, and the receipts of bullion this month are likely to exceed those of September. Crown Point has been dull and inactive at $1,025@$900, closing at $900 hid. Belcher steadily fell from $805 to $575, then sold at $590, and closed at $590.

Hale & Norcross declined from $675 to $415, rallied to $460, dropped to $405, and was dealt in yesterday at $415@$510. Within this range some 300 feet changed hands. It is said a survey of the surfaee of this claim shows that a considerable portion of the developments made reeently in the seuth winze are within the line of the Chollar-Potosi Company.

Ophir has been actively dealt in, and some 299 feet were sold, reeeding from $515 to $417, then changing hands at $390, and closing at about $380. There is nothing new from this elaim. Chollar was dealt in to the extent of 250 feet, advancing from $460 to $500, buyer 30, dropping to $445, then selling at $400, and closiug at $435. Potosi has also been active, and 245 feet changed hands at $460@$390, closing at $412. Advices from this mine continue favorable:

Imperial, in view of the decline of all other stoeks, has been rather well sustained; declining from $226 dividend on to $185 ex-dividend, advanciug to $220, reeeding to $200, rallying to $205, and selling yesterday at $190@$197½. More than 1,000 shares were sold within this range. The company has purchased the Lindauer & Hirschman mill on the Carson for $60,000, payable in monthly installments, ruuning over a period of six months. This mill is said to he complete in all respects, with 24 stamps, and cost about the sum to be paid for it. It is now at work for its new owners, and will crush some 15 tons of orc per day, without interfering with the present water-power of the Rock Point Mill. This latter establishment reduced, last month, 1,500 tons of ore, yielding $57,019.45, or an average of $38.01 per ton, and the Gold Hill mill crushed 907 tons, which yielded $31,089.05, an average of $34.28 per ton. During the month of September, 2,815 tons were extracted from the mine, leaving on hand 2,183 tons September 30th. The crushing capacity of the three mills will probably exceed 3,000 tons this month, (some 600 tons more than last,) and the receipts of bullion are likely, therefore, to he increased.

Empire Mill nnd Mining Company fell from 237 to 200, and closed at $200. Overman dropped from $120 to $100, nnd sold yesterday at $105. Bullion fell from $142 to $90, then sold at $97, and closed at $100. Sierra Nevada was sold at $23@$17, closing at $18, and Daney closed at about $25 hid. The recorded sales of Stocks since Saturday, last inclusive, amounted in the aggregate to $1,166,909.
